PURPOSE OF REPORT

Nelson & Pope has investigated the potential traffic impacts associated with the proposed residential development “The Preserve @ Islandia” to be located on the eastside of Old Nichols Road south of Dean Street in the Village of Islandia, Town of Islip, Suffolk County, New York. The proposed residential development will be located on a parcel of land designated as District 504, Section 17, Block 03, Lots 7 & 8 on the Suffolk County Tax maps and comprised of a total of 72 Residential Condominium units (47 age restricted units and 25 non age restricted units). The site currently contains an Equestrian Center.

Access to the site will be provided via one full movement driveway on Old Nichols Road.

This report summarizes the results of a detailed investigation of the traffic impacts of the proposed development by reviewing the area’s existing roadway characteristics and traffic conditions, estimating the vehicular volume and pattern that the proposed development will generate during peak hours, and analyzing the effect of the additional volume on the surrounding roadway network.

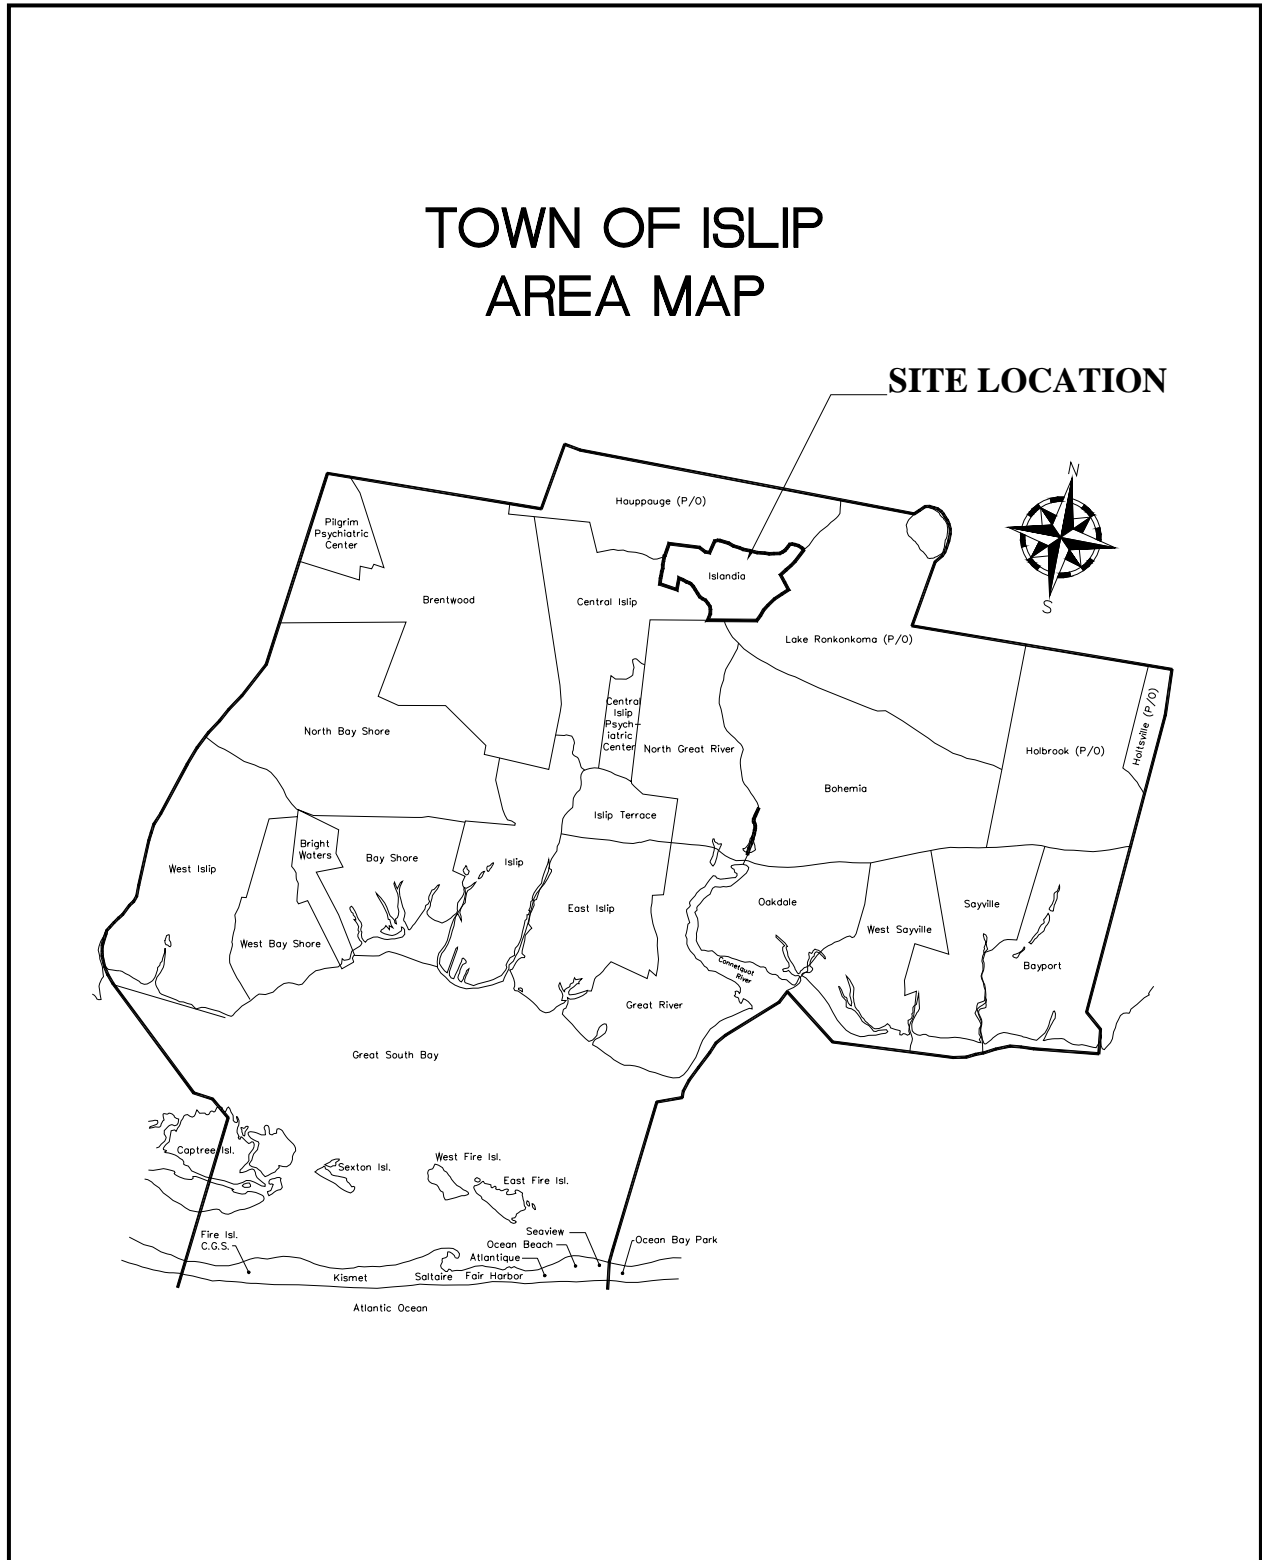

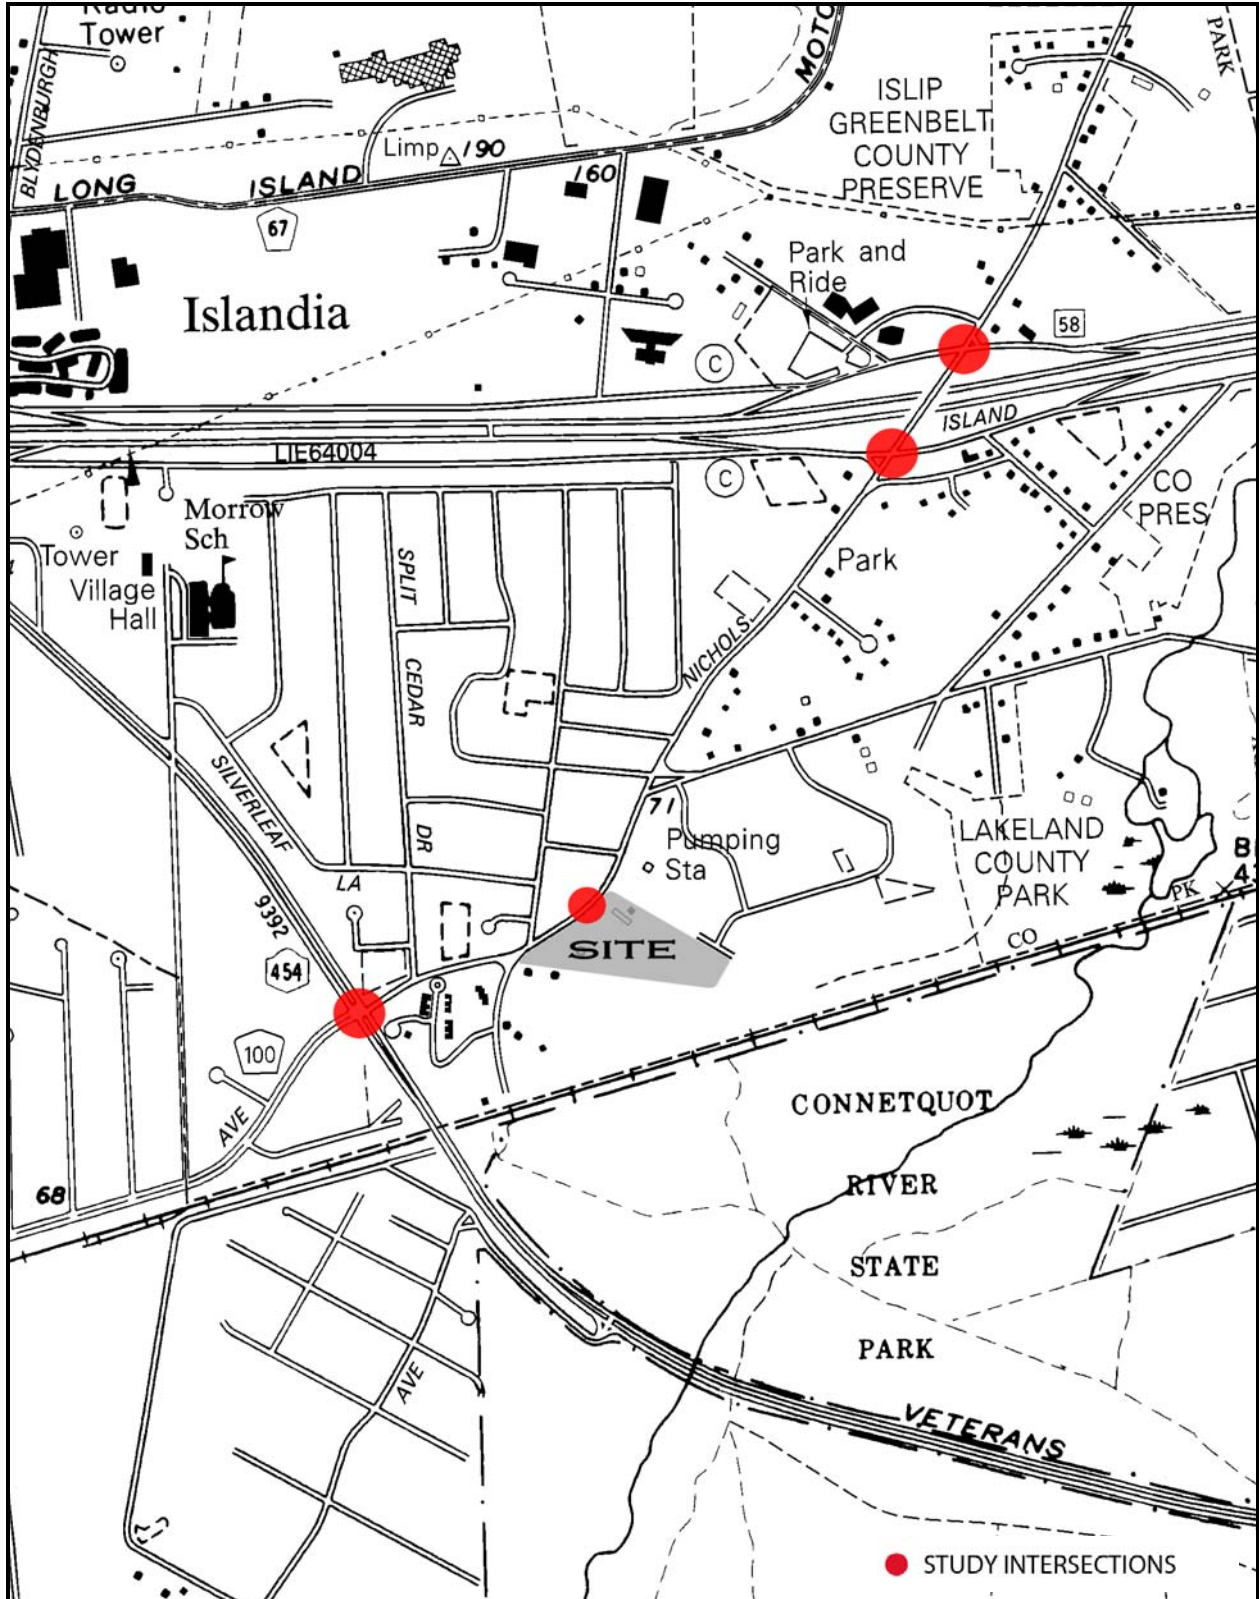

Figure 1: Area Map

SOURCE: USGS MIDDLE ISLAND 1991

Figure 2: Location Map

STUDY METHODOLOGY

The study assesses the traffic impacts associated with the proposed development and identifies appropriate mitigation, if necessary. In executing the scope of work, the following steps were undertaken.

- A detailed field inspection was conducted to obtain an inventory of existing roadway geometry, location/geometry of existing driveways and intersections along with signing, signal timings, phasing and cycle lengths. The field inspection was reviewed to determine which intersections to be studied. From the field inspection, it was determined that, even though Johnson Avenue is a significant location within the study area, it should not attract traffic from the proposed residential development due to its residential nature. The site generated traffic anticipated to traverse the intersection of Old Nichols Road and Johnson Avenue will be through traffic and should not significantly impact the intersection. Therefore the intersection of Old Nichols Road and Johnson Avenue was not studied.
- Turning movement volume counts were conducted during the weekday morning (7:00 AM to 9:00AM), weekday evening (4:00 PM to 6:00 PM) and Saturday midday (11:00 AM to 2:00 PM) peak periods at the following intersections which were considered to be most likely impacted by the proposed residential development:
 - Veterans Highway (NYS Route 454) at Old Nichols Road/East Suffolk Avenue (CR 100)
 - Old Nichols Road at Long Island Expressway (LIE) South Service Road
 - Old Nichols Road at Long Island Expressway (LIE) North Service Road
- Hourly traffic volumes collected on Veterans Highway (NYS Route 454) and LIE North and South Service Roads in the vicinity of Old Nichols Road were obtained from the New York State Department of Transportation (NYSDOT).
- Accident data for the study intersections and roadways in the vicinity of the site was obtained from the New York State Department of Transportation (NYSDOT).

- The Town of Islip Department of Planning was contacted to obtain information on other planned projects in the nearby area that may affect the study intersections.
- An annual growth factor of 1.2% obtained from the NYSDOT LITP2000 Study for the Town of Islip was applied to the existing traffic volumes to estimate the increase in background traffic that would occur in 2009. These traffic volumes are referred to as Ambient Traffic Volumes.
- The 2009 No Build Volumes were developed by adding the other planned projects traffic to the ambient traffic volumes.
- Estimates of traffic that would be generated by the proposed development was prepared utilizing traffic volume data collected at the Silver Woods condominium development south of the proposed site and trip generation data published by the Institute of Transportation Engineers (ITE) publication, *Trip Generation, Seventh Edition*. The site-generated traffic volumes were assigned to the adjacent street system based upon the anticipated directional trip distribution forecasted by Nelson & Pope.
- The 2009 Build Condition volumes for the proposed development were developed by adding the site generated traffic to the 2009 No Build Condition volumes.
- Capacity analyses were performed at the study intersections identified above for the Existing Condition, No Build Condition and Build Condition for the weekday AM, PM and Saturday midday peak hours. Capacity analyses were also conducted at the site driveway for the Build Condition during the weekday AM, PM and Saturday midday peak hours.
- The results of the analyses for the 2009 No Build Conditions and the 2009 Build Conditions were compared to identify any significant impact associated with the proposed development.
- In accordance with the findings of the capacity computations, where appropriate, recommendations were made to mitigate the project traffic impacts.

EXISTING CONDITION

Land Use

As previously discussed the proposed residential development “The Preserve @ Islandia” will be located on the eastside of Old Nichols Road on a parcel of land designated as District 504, Section 17, Block 03, Lots 7 & 8 on the Suffolk County Tax maps in the Village of Islandia, Town of Islip, New York. The site currently contains an Equestrian Center.

Roadway Conditions

The following is a list of roadways included in the study network surrounding the site. The greatest portion of the traffic generated by the proposed developments will be distributed throughout the network. The general descriptions listed here refer only to the sections of the roadways that exist near the site. Their cross-section may vary further away from the site. The Average Annual Daily Traffic (AADT) is listed for each roadway where available in the most recent NYDOT Local Highway Traffic Volumes Report.

Veterans Highway (NYS Route 454) is a principal arterial under the jurisdiction of the New York State Department of Transportation (NYSDOT) with a general northwest/southeast orientation in the Vicinity of Nichols Road. However, for the purpose of this study, Veterans Highway is considered an east/west roadway. Veterans Highway in the vicinity of Old Nichols Road is a four-lane, divided roadway with exclusive turn lanes at key intersection and a posted speed limit of 55 miles per hour. This section of NYS Route 454, between the Long Island Expressway and Suffolk Avenue (CR 100), has an average annual daily traffic (AADT) volume of approximately 33,456 vehicles per day (source: NYSDOT Traffic Volume Report 2006) and NYS Route 454 between Suffolk Avenue (CR 100) and Lakeland Avenue, has an average annual daily traffic (AADT) volume of approximately 40,900 vehicles per day (source: NYSDOT Traffic Volume Report 2004).

The ***Long Island Expressway North Service Road*** is a principal arterial under the jurisdiction of the Suffolk County Department of Public Works (SCDPW) in the vicinity of Old Nichols Road and is a two-lane westbound one-way roadway with a posted speed limit of 40 miles per hour. This section of the North Service Road, between Old Nichols Road and Terry Road, has an

AADT of approximately 4,936 vehicles per day (source: NYSDOT Traffic Volume Report 2005).

The *Long Island Expressway South Service Road* is a principal arterial under the jurisdiction of the SCDPW in the vicinity of Old Nichols Road and is a two-lane, eastbound one-way roadway with a posted speed limit of 40 miles per hour. This section of the South Service Road, between Veterans Highway and Old Nichols Road, has an AADT of approximately 5,445 vehicles per day (source: NYSDOT Traffic Volume Report 2005).

Old Nichols Road is a collector roadway under the jurisdiction of the Village of Islandia and provides one lane per travel direction in the vicinity of the site. Nichols Road is generally a northeast/southwest roadway; however, for the purpose of this study it is considered a north/south roadway. The posted speed limit on Old Nichols Road in the vicinity of the site is 30 miles per hour.

Table 1 summarizes the lane configurations and traffic controls at the study intersections.

Table 1: Intersection Geometry

Intersection	Approach	Lane Designation*	Traffic Control

	WB	L-2T-R	
	NB	L-2T-R	
	SB	L-T-TR	
Old Nichols Road at LIE South Service Road	EB	2L-T-TR	Traffic Signal
	NB	2T-R	
	SB	2L-2T	
Old Nichols Road at LIE North Service Road	WB	2L-2T-TR	Traffic Signal
	NB	2L-2T	
	SB	2T-TR-R	

* L = Left turn lane; T = through lane; R = Right turn lane

Bicycle and Transit Facilities

The Central Islip station of the Long Island Railroad (LIRR) is located on Suffolk Avenue approximately 1.5 miles from the proposed site. Suffolk County Bus Route 3D, Brentwood to Stony Brook Railroad, runs along Suffolk Avenue and Old Nichols Road with two designated stops in the vicinity of the site. Suffolk County Bus Route S54, Patchogue Railroad to Walt Whitman Mall runs along Veterans Memorial Highway in the vicinity of the site with a stop at the intersection of Old Nichols Road/Suffolk

Avenue and Veterans Memorial Highway. Also Nichols Road is a signed bicycle route. The bicycle route extends from Johnson Avenue to Veterans Memorial Highway, connecting with the state bicycle route on Veteran Memorial Highway and continues westerly on to Suffolk Avenue.

Traffic Volume Data

Weekday turning movement counts were collected at the study intersections on Wednesday and Thursday November 14 and 15, 2007 during the AM (7:00-9:00 AM) and PM (4:00-6:00 PM) peak periods. The weekend turning movement counts were collected on Saturday, November 17, 2007 during the Saturday midday peak period (11:00 AM – 2:00 PM). The volume data was tabulated to identify the peak hours at the study intersection.

Seasonal adjustment factors of 1.025 and 0.856 for weekday and weekend respectively for the month of November (month of counts) were obtained from data contained in the 2006 NYSDOT Traffic Data Report. These seasonal adjustment factors were developed from NYSDOT continuous data collected for a three year period. Applying the weekday normalization factor for the month of November to the traffic count data collected would effectively reduce the existing peak hour volumes. Therefore to be conservative, the weekday peak hour traffic volumes collected during the month of November were not normalized. However, applying the weekend normalization factor to the weekend volumes will increase the weekend volumes, hence the weekend volumes were normalized. The existing intersection peak hour volumes are shown on Figures 3, 4, and 5 and detailed data are contained in Appendix A.

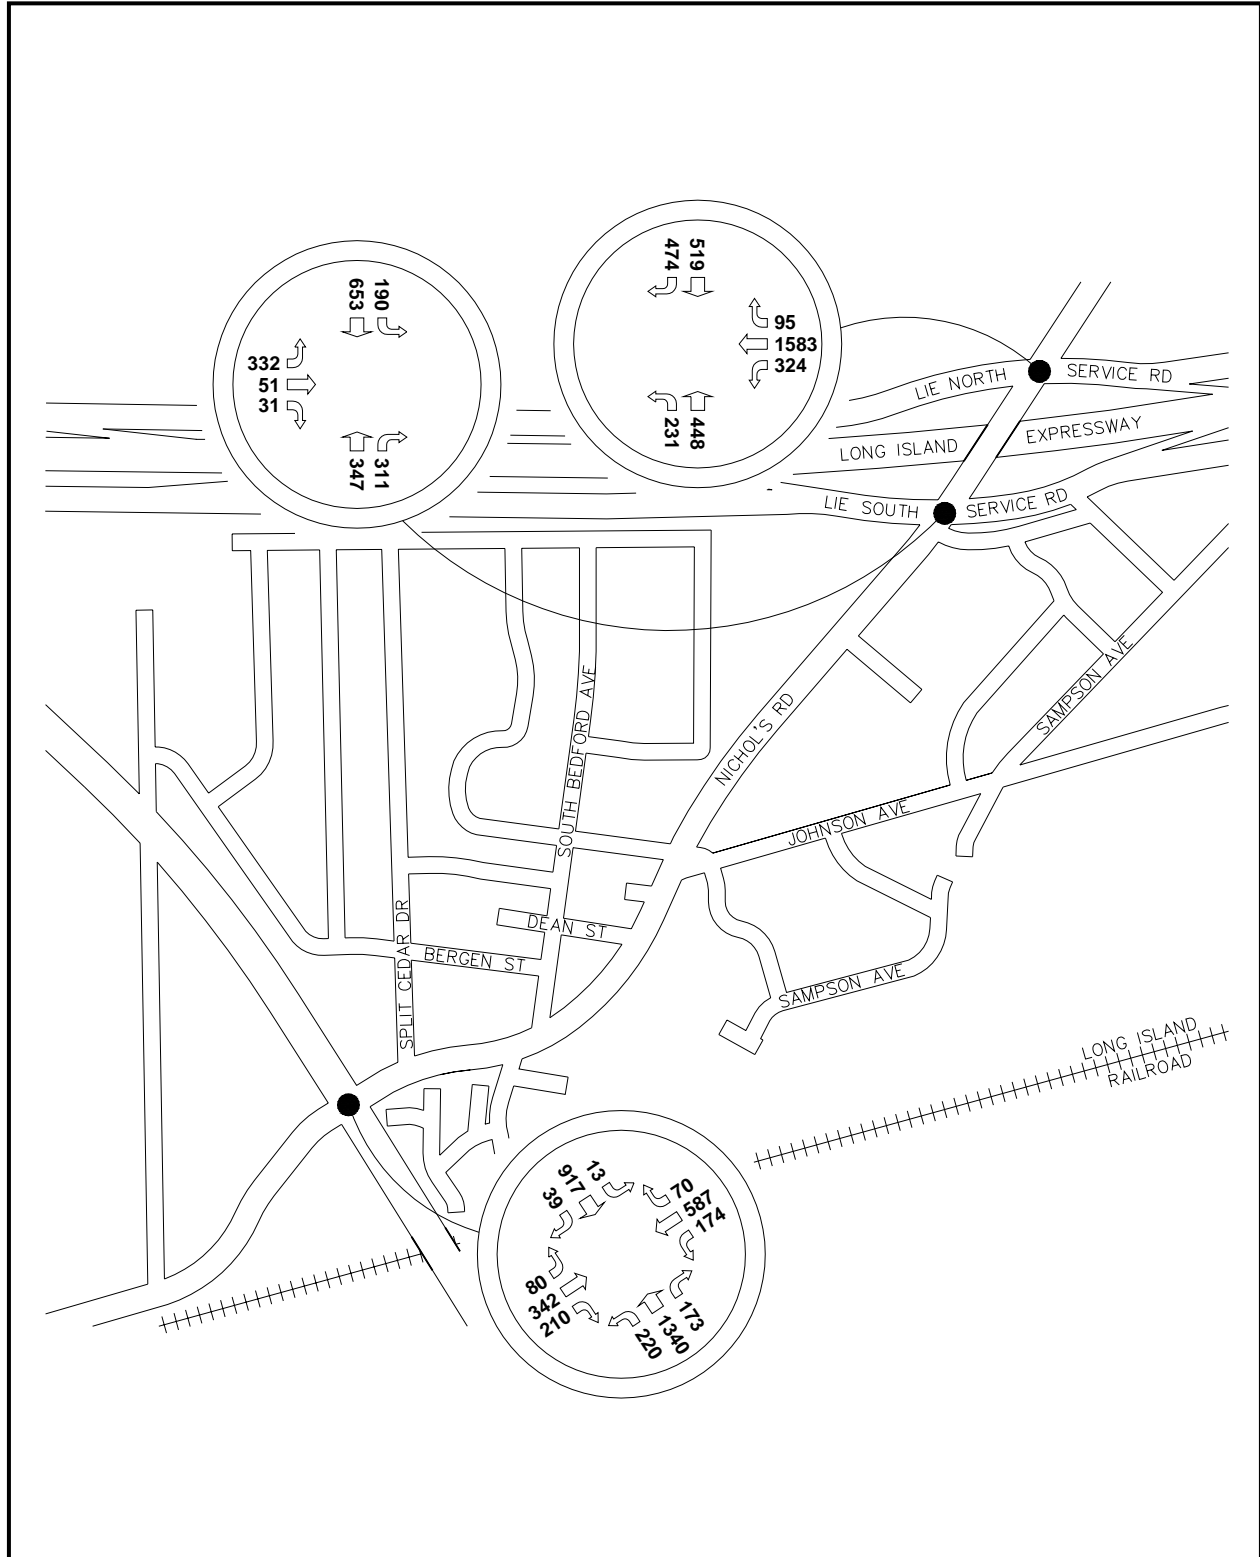

Figure 3: Existing AM Peak Hour Traffic Volumes

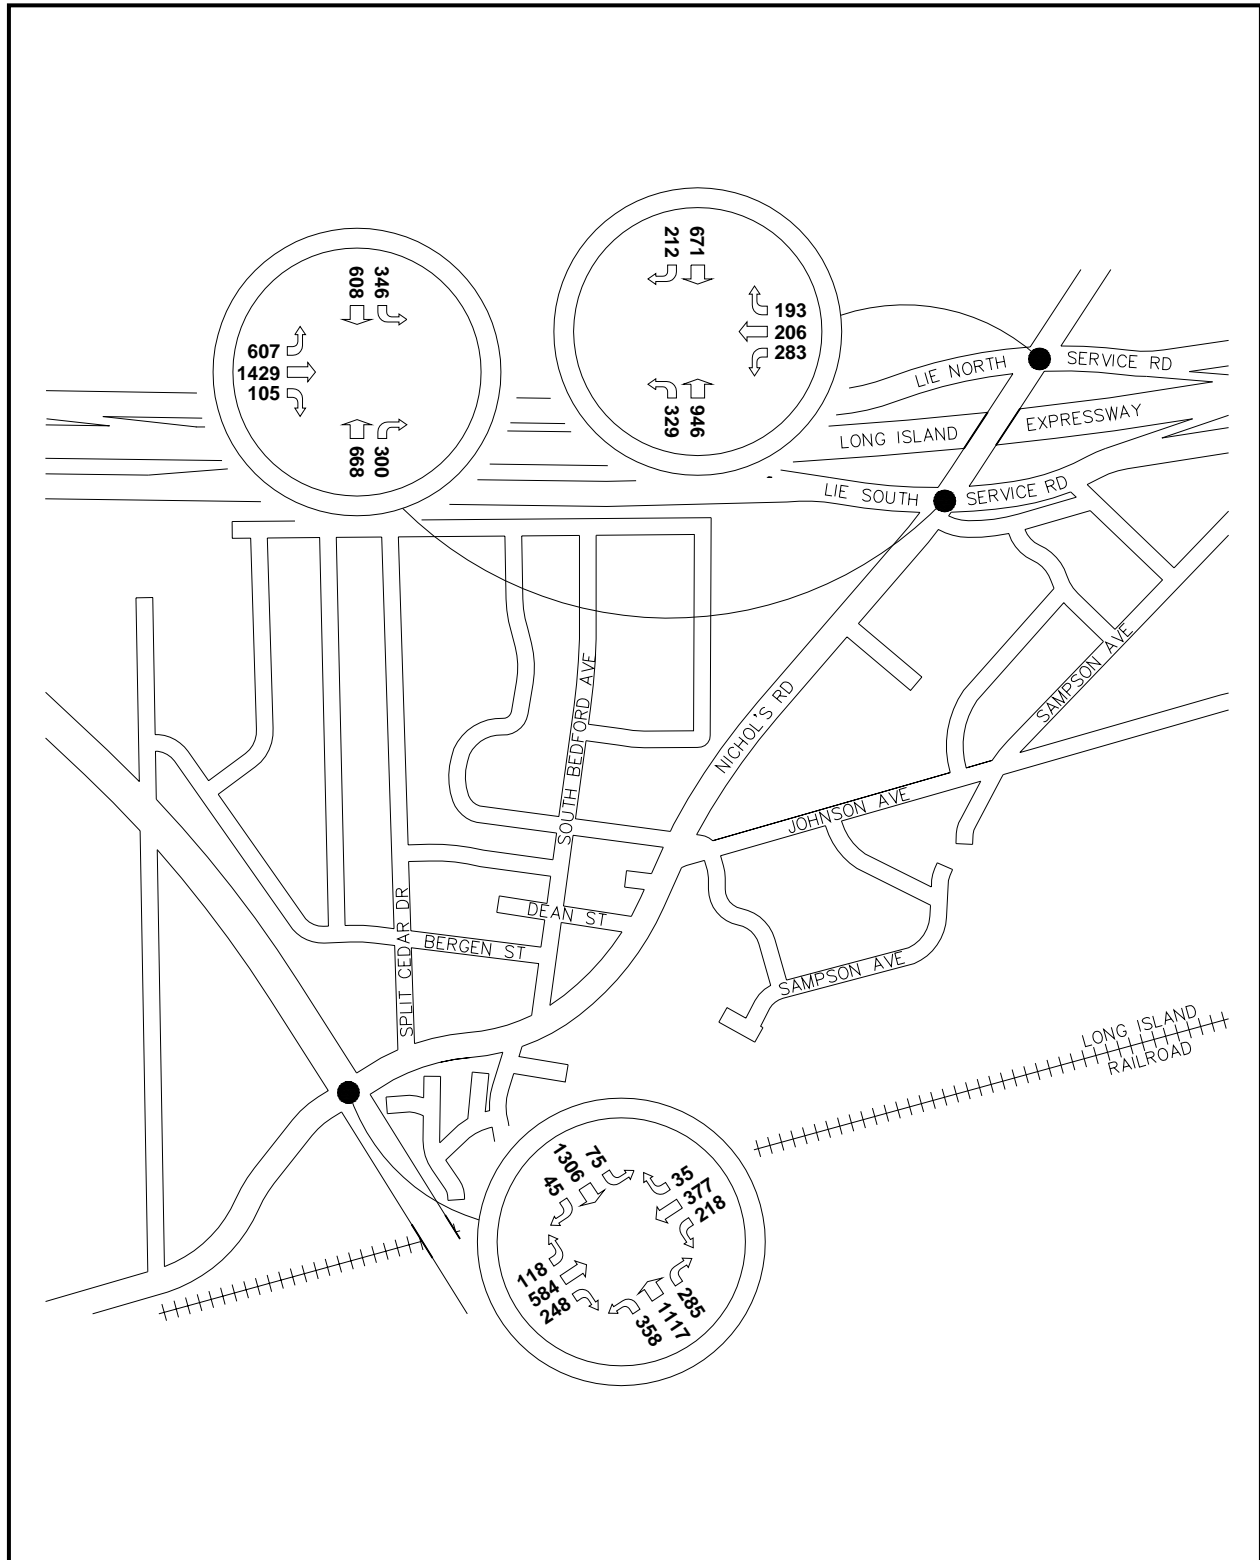

Figure 4: Existing PM Peak Hour Traffic Volumes

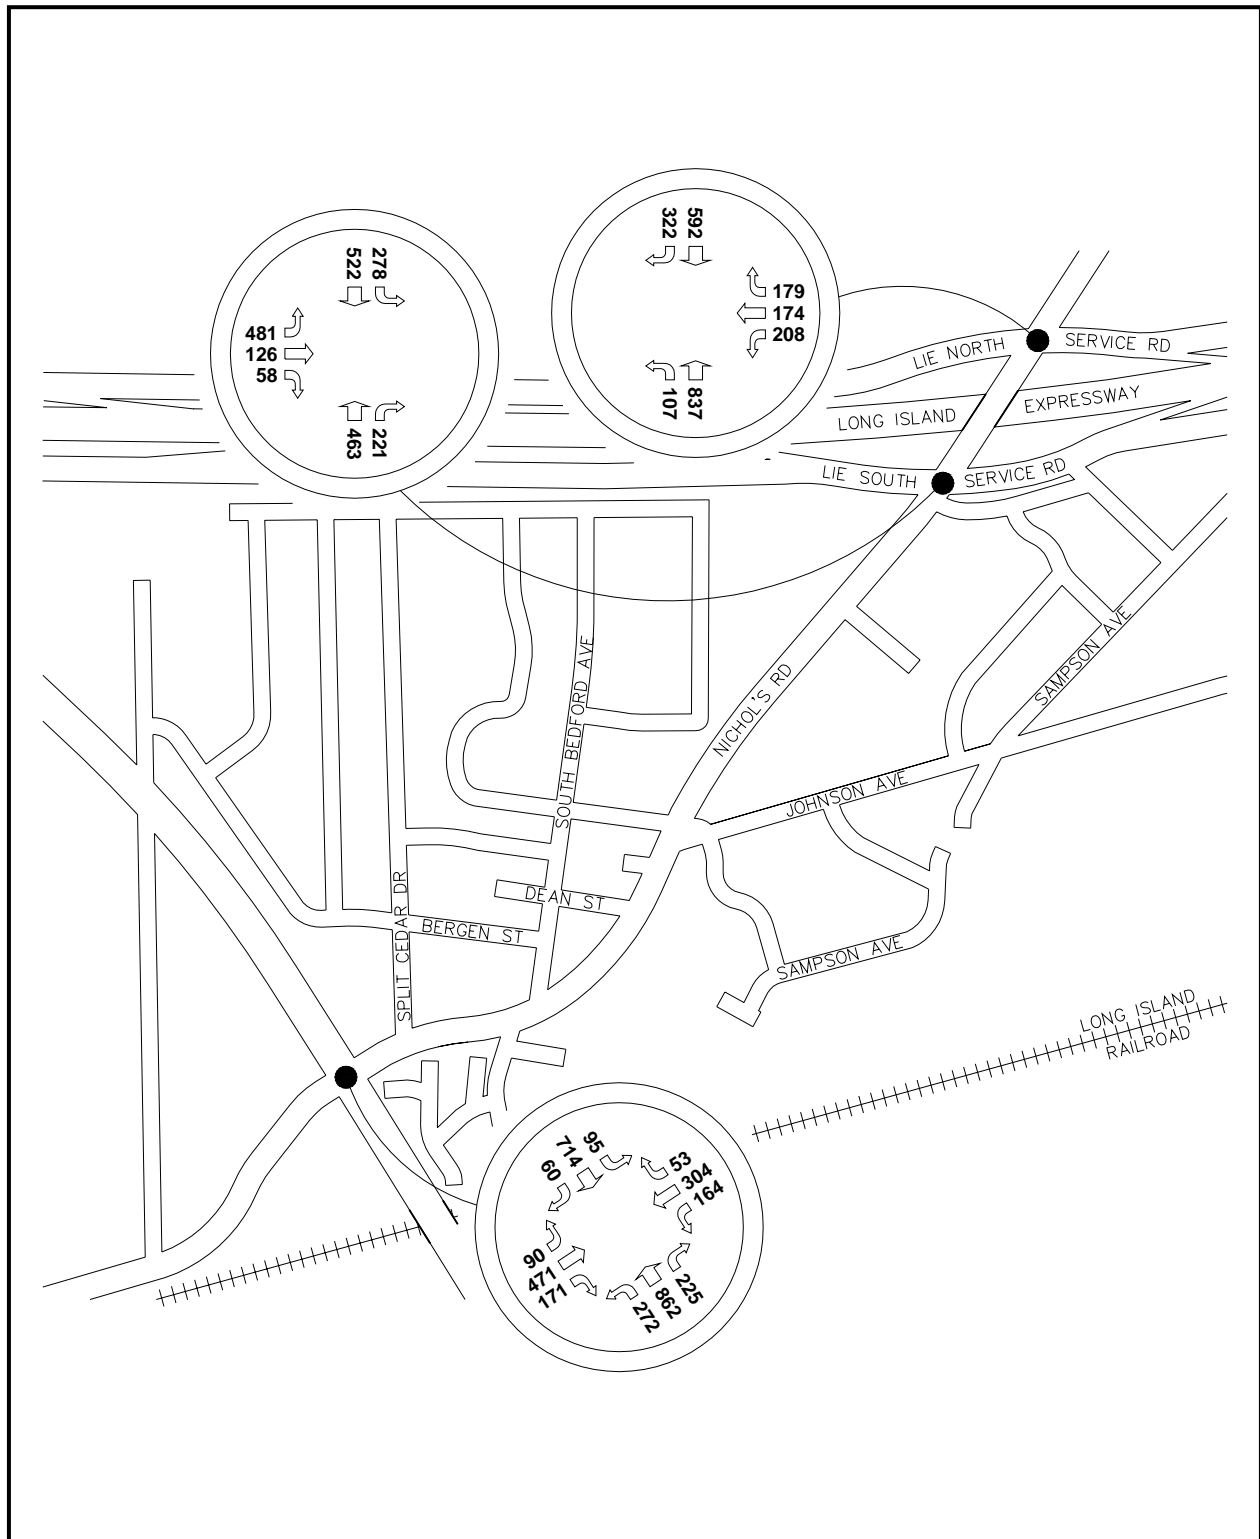

Figure 5: Existing Saturday Peak Hour Traffic Volumes

Accident History

Accident data for the sections of roadways and intersections in the vicinity of the site was obtained from the NYSDOT. The most recent data available was from July 2004 to June 2007 (3 year period). The data was reviewed and summarized in the following tables.

Table 2: Accident Summary by Severity

Location	Accident Severity				TOTAL	
	Fatality	Injury	Property Damage	Non-Reportable		
LIE North Service Road at Old Nichols Road	-	-	2	-	2	
Old Nichols Road between LIE North Service Road and LIE South Service Road	-	4	1	-	5	
LIE South Service Road at Old Nichols Road	-	-	-	-	0	
Old Nichols Road between LIE South Service Road and Hancock Street	-	-	-	-	0	
Old Nichols Road at Hancock Street	-	-	-	-	0	
Old Nichols Road between Hancock Street and Halsey Street	-	-	-	-	0	
Old Nichols Road at Johnson Avenue	-	3	2	-	5	
Old Nichols Road between Johnson Avenue and Dean Street	-	-	1	-	1	
Old Nichols Road at Dean Street	-	-	-	-	0

Old Nichols Road at Bedford Drive	-	-	1	-	1	
Old Nichols Road between Bedford Drive and Ernhardht Way	-	-	-	-	0	
Nichols Road at Ernhardht Way	-	-	-	-	0	
Old Nichols Road between Ernhardht Way and Split Cedar Drive	-	-	-	-	0	
Old Nichols Road at Split Cedar Drive	-	2	2	-	4	
Old Nichols Road between Split Cedar Drive and NYS Route 454 (Veterans Memorial Highway)	-	-	-	-	-	
Old Nichols Road at NYS Route 454 (Veterans Memorial Highway)	1	34	22	2	59	
	Total	2 3%	43 55%	31 39%	2 3%	78 100%

Table 2 indicates a total of 78 accidents occurred at or in the vicinity of the study intersections during the analysis period. A total of two accidents involved fatalities during the study period,

one of them resulting in two fatalities which occurred at the intersection of Nichols Road and Veterans Road (NYS Route 454). This accident involved a vehicle making a right turn onto Nichols Road from westbound Veterans Road and a bus traveling north on Suffolk Avenue/Nichols Road. Driver inattention was attributed to the accident. The other fatal accident resulting in one fatality occurred on Old Nichols Road between Dean Street and Bedford Drive and involved a pedestrian. The location with the greatest number of accidents is the intersection of Old Nichols Road and Veterans Parkway (NYS Route 454).

Table 3: Accident Summary by Type of Collision

Location	Accident Type										Total
	Right Angle	Rear End	Head On	Left Turn	Right Turn	Fixed Object	Ped/Bicycle	Parked Vehicle	Over-Taking	Other/Unknown	
LIE North Service Road at Old Nichols Road	-	1	-	-	1	-	-	-	-	-	2
Old Nichols Road between LIE North Service Road and LIE South Service Road	1	1	-	1	-	-	-	-	1	1	5
LIE South Service Road at Old Nichols Road	-	-	-	-	-	-	-	-	-	-	0
Old Nichols Road between LIE South Service Road and Hancock Street	-	-	-	-	-	-	-	-	-	-	0
Old Nichols Road at Hancock Street	-	-	-	-	-	-	-	-	-	-	0
Old Nichols Road between Hancock Street and Halsey Street	-	-	-	-	-	-	-	-	-	-	0

Old Nichols Road between Johnson Avenue and Dean Street	-	1	-	-	-	-	-	-	-	-	1
Old Nichols Road at Dean Street	-	-	-	-	-	-	-	-	-	-	0
Old Nichols Road between Dean Street and Bedford Drive	-	-	-	-	-	-	1	-	-	-	1
Old Nichols Road at Bedford Drive	-	-	-	-	-	1	-	-	-	-	1

Location	Accident Type										Total
	Right Angle	Rear End	Head On	Left Turn	Right Turn	Fixed Object	Ped/Bicycle	Parked Vehicle	Over-Taking	Other/Unknown	
Old Nichols Road between Bedford Drive and Ernhardt Way	-	-	-	-	-	-	-	-	-	-	0
Old Nichols Road at Ernhardt Way	-	-	-	-	-	-	-	-	-	-	0
Old Nichols Road between Ernhardt Way and Split Cedar Drive	-	-	-	-	-	-	-	-	-	-	0
Old Nichols Road at Split Cedar Drive	-	-	-	2	-	-	-	-	1	1	4
Old Nichols Road between Split Cedar Drive and NYS Route 454 (Veterans Memorial Highway)	-	-	-	-	-	-	-	-	-	-	0
Old Nichols Road at NYS Route 454 (Veterans Memorial Highway)	5	18	-	11	1	1	-	-	3	20	59
Total	6 8%	23 29%	0 0%	15 19%	2 3%	2 3%	1 1%	0 0%	5 6%	24 31%	78 100%

A review of Table 3 indicates that a plurality of the accidents (31%) involved unknown type of accidents, the second most frequent reportable accidents (29%) involved rear-end accidents and the third most frequent accidents (19%) involved left turn accidents. A majority of the accidents (76%) occurred at the intersection of Old Nichols Road and Veterans Parkway (NYS Route 454).

LEVEL OF SERVICE DESCRIPTION

While traffic volumes provide an important measure of activity on the adjacent roadway network, evaluating how well that network accommodates those volumes is also important. Therefore, a comparison of peak hour traffic volumes with available roadway capacity is prepared. Capacity, by definition, represents the maximum number of vehicles that can be accommodated given the constraints of roadway geometry, traffic characteristics and controls. Intersections primarily control capacity in roadway networks, since conflicts exist at these points between through, crossing and turning traffic. Because of these conflicts, congestion is most likely to occur at intersections. Therefore, intersections are studied most often when determining the quality of traffic flow.

Level of service and capacity analyses for the study intersections were performed using Highway Capacity Software (*HCS+*) Release 5.21, prepared by the Federal Highway Administration. HCS+ is a series of computer programs strictly adhering to the guidelines set forth in *Highway Capacity Manual 2000 (HCM2000)*. *HCM2000* contains procedures and methodologies for estimating capacity and determining level of service for many transportation facilities and modes including signalized and unsignalized intersections.

An intersection's level of service (LOS) describes its quality of traffic flow. It ranges in grade from LOS "A" (relatively congestion-free) to LOS "F" (very congested). The level of service definition, as well as the threshold values for each level, varies according to whether the intersection is controlled by a signal or a stop sign. A brief description is given here and a more detailed definition is found in Appendix C.

The capacity of a signalized intersection is evaluated in terms of the ratio of demand flow rate to capacity (V/C ratio). The capacity for each approach represents the maximum rate of flow (for the subject approach) which may pass through the intersection under prevailing traffic, roadway and signal conditions. The level of service of a signalized intersection is evaluated on the basis of average control-delay measured in seconds per vehicle (sec/veh). The control-delay is calculated using an equation that combines the stopped-delay with the vehicle acceleration/deceleration delay that is caused by the signalized intersection. At the signalized

intersections, factors that affect the various approach capacities include width of approach, number of lanes, signal “green time”, turning percentages, truck volumes, etc. However, delay cannot be related to capacity in a simple one-to-one fashion. For example, it is possible to have delays in the Level of Service “F” range without exceeding roadway capacity. Substantial delays can exist without exceeding capacity if one or more of the following conditions exist: long signal cycle length; a particular traffic movement experiences a long red time; or progressive movements for a particular lane is poor.

EXISTING CONDITION ANALYSIS

The 2007 existing peak hour traffic volumes depicted in Figures 3, 4 and 5 were used to determine the existing capacity and LOS of the study intersections. Table 4 contains the LOS summary for the Existing Condition calculated through the HCS software described previously. The detailed analysis worksheets are in Appendix D.

Table 4: Existing Condition LOS Summary

Location (Signalized Intersections)	AM Peak Hour		PM Peak Hour		Saturday Midday Peak Hour	
	LOS	Delay	LOS	Delay	LOS	Delay
Veterans Highway (NYS Route 454) at Old Nichols Road/East Suffolk Avenue (CR 100)	36.8	D	65.8	E	37.0	D
Old Nichols Road at LIE South Service Road	20.0	B	45.8	D	19.8	B
Old Nichols Road at LIE North Service Road	34.6	C	24.1	C	19.0	B

Veterans Highway (NYS Route 454) at Old Nichols Road/East Suffolk Avenue (CR 100)

The signalized intersection of Veterans Highway at Old Nichols Road/East Suffolk Avenue currently operates at LOS D, E and D during the weekday AM, PM and Saturday midday peak hours respectively.

Old Nichols Road at LIE South Service Road

The signalized intersection of Old Nichols Road at LIE South Service Road currently operates at LOS B, D and B during the weekday AM, PM and Saturday midday peak hours respectively.

Old Nichols Road at LIE North Service Road

The signalized intersection of Old Nichols Road at LIE North Service Road currently operates at LOS C, C and B during the weekday AM, PM and Saturday midday peak hours respectively.

NO BUILD CONDITION

The No Build Condition represents traffic conditions expected at the study intersections in the future year 2009 without the construction of the proposed project. The No Build Condition traffic volumes are estimated based on two factors as follows:

- Increases in traffic due to general population growth and developments outside of the immediate project area. This traffic increase is referred to as ambient growth.
- Other planned projects located near the project site that may affect traffic levels and patterns at the study intersections in this report.

Traffic Growth

A 1.2% annual growth factor was obtained from the NYSDOT. The existing traffic volumes were increased by this factor for a period of 2 years to project volumes to the year 2009.

Other Planned Projects

Planned projects to be constructed prior to the proposed project that may significantly influence the traffic flow through the study intersections would be considered as part of the No Build analysis. The Town of Islip and Village of Islandia were contacted to obtain information on any planned projects in the area. At the time this study was conducted, no other planned projects were identified. The 2009 No Build traffic volumes are shown on figures 6, 7 and 8.

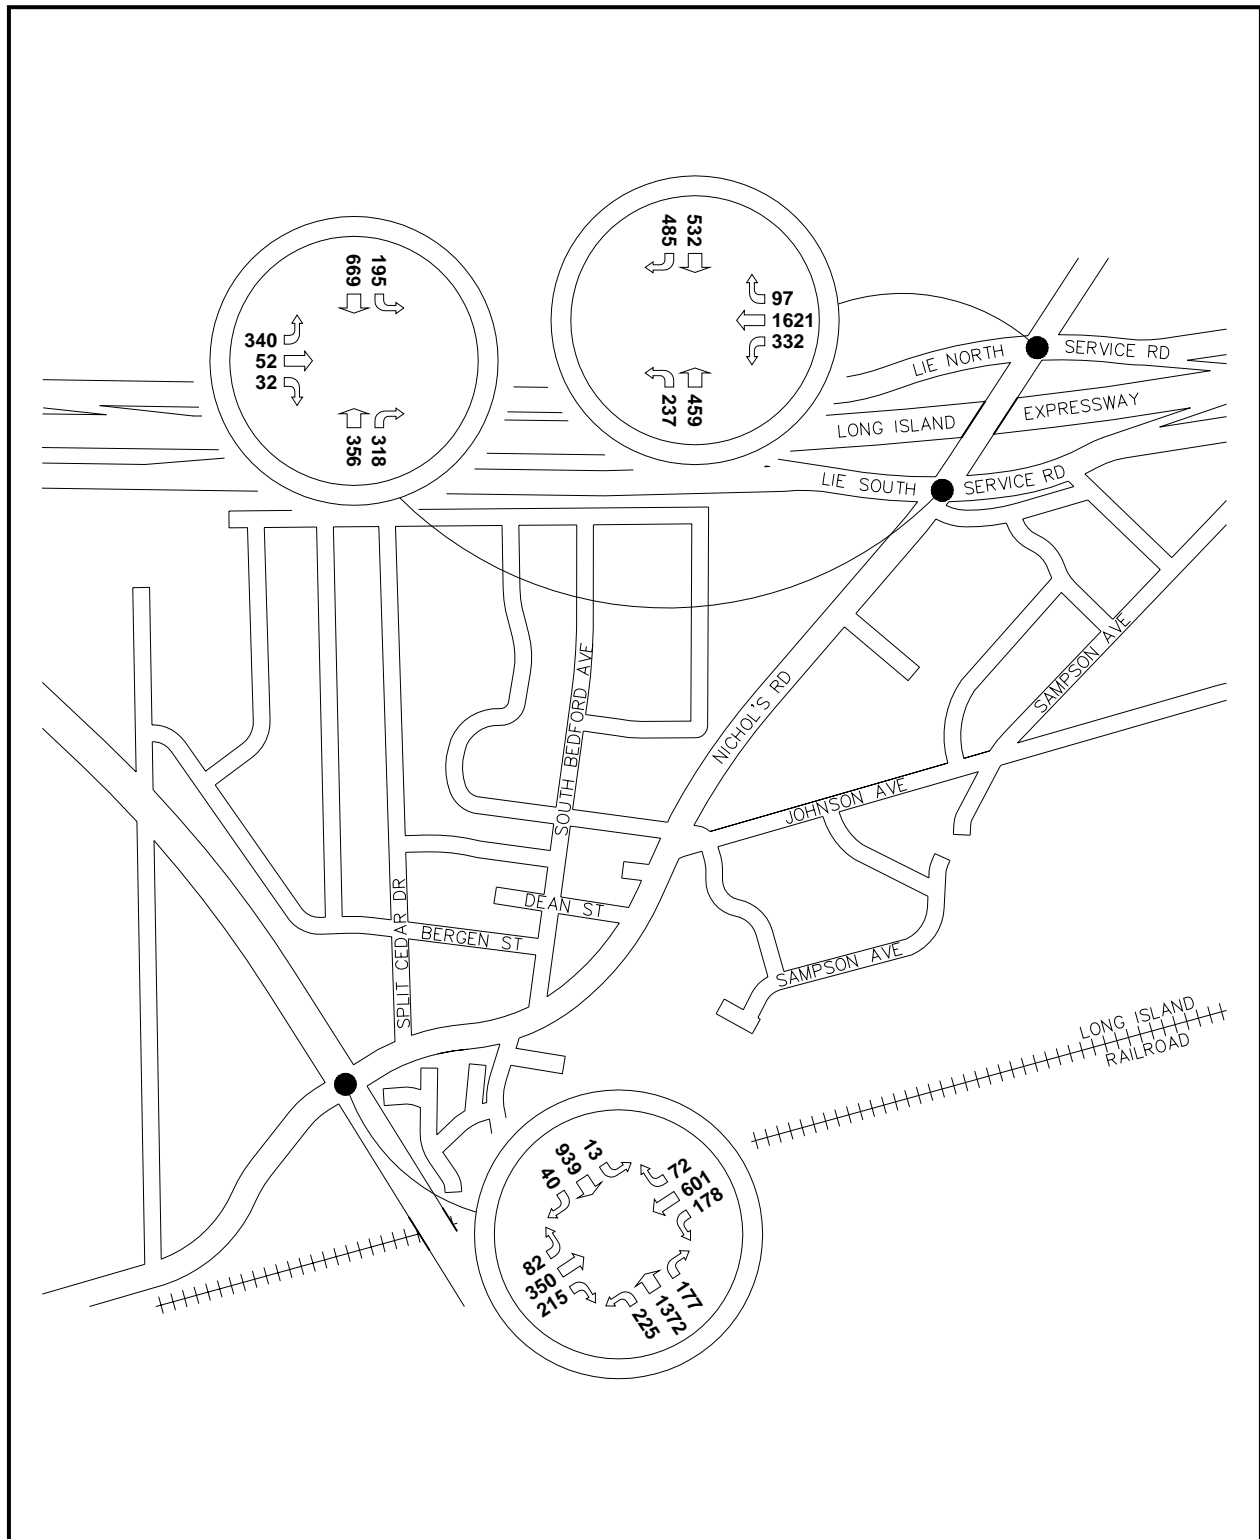

Figure 6: 2009 No Build AM Peak Hour Traffic Volumes

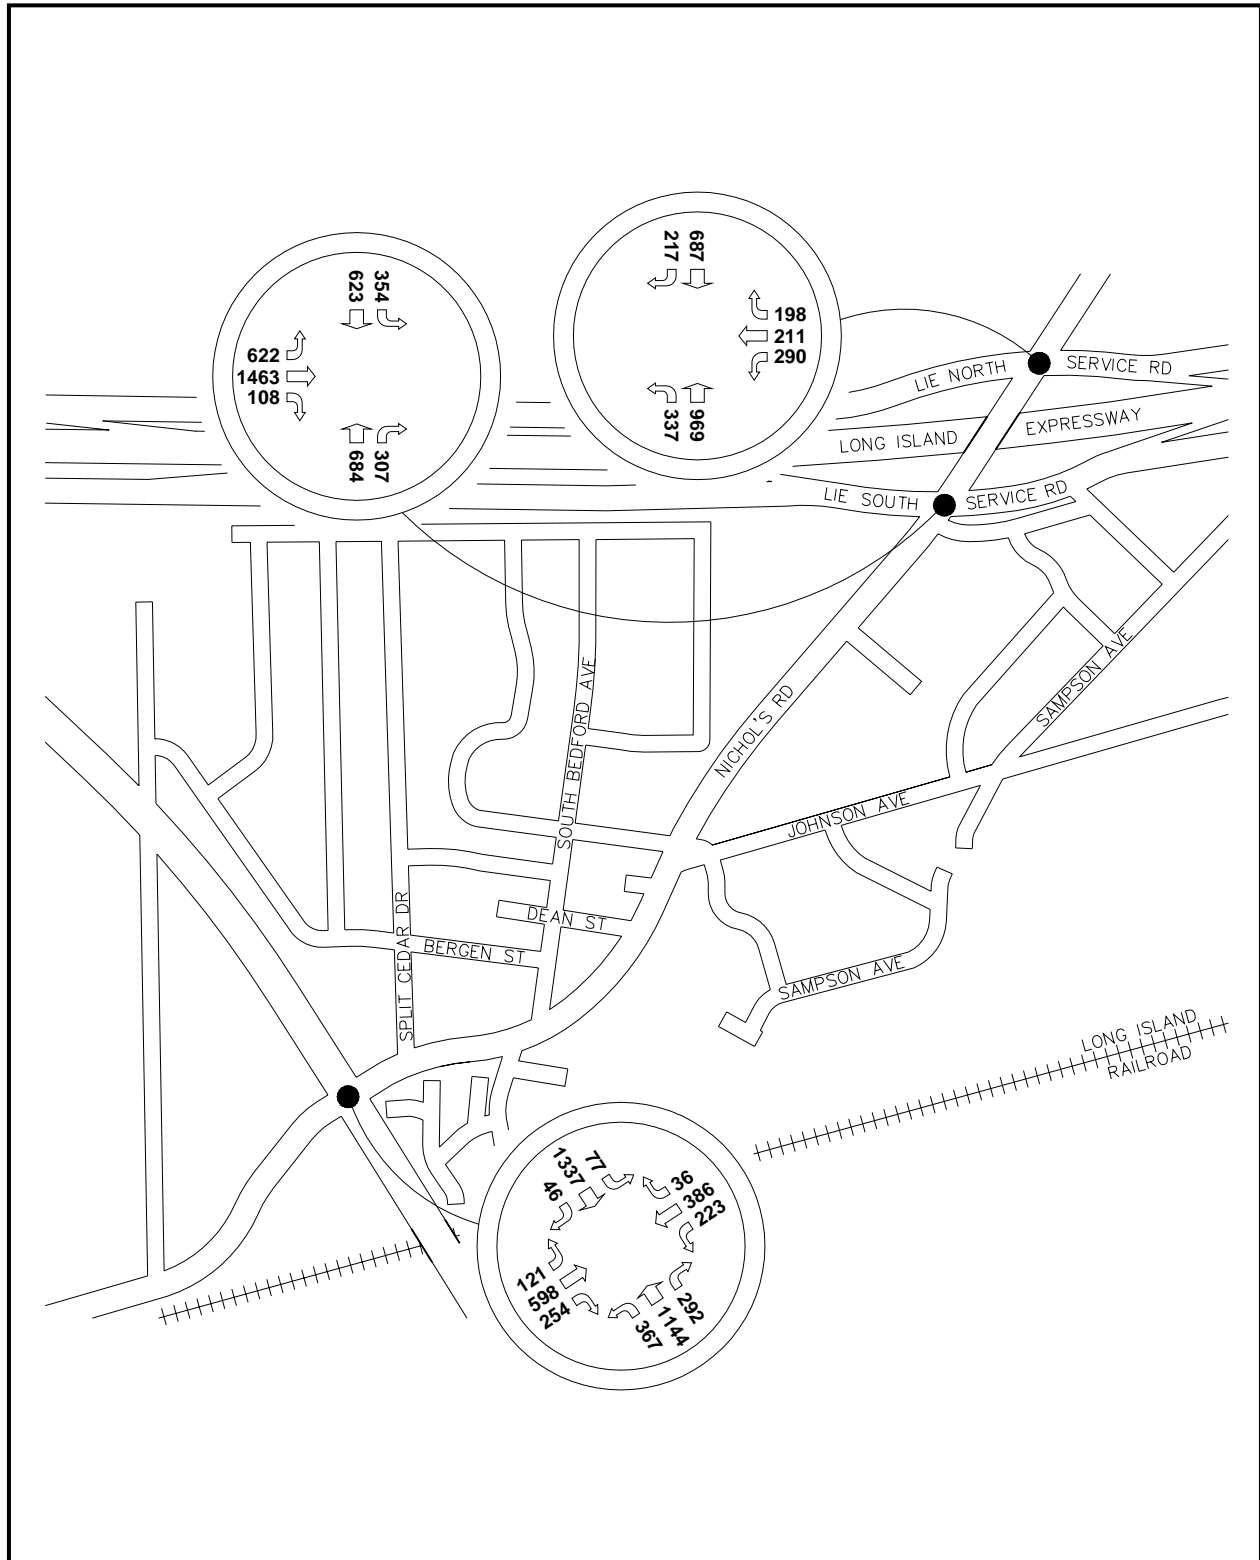

Figure 7: 2009 No Build PM Peak Hour Traffic Volumes

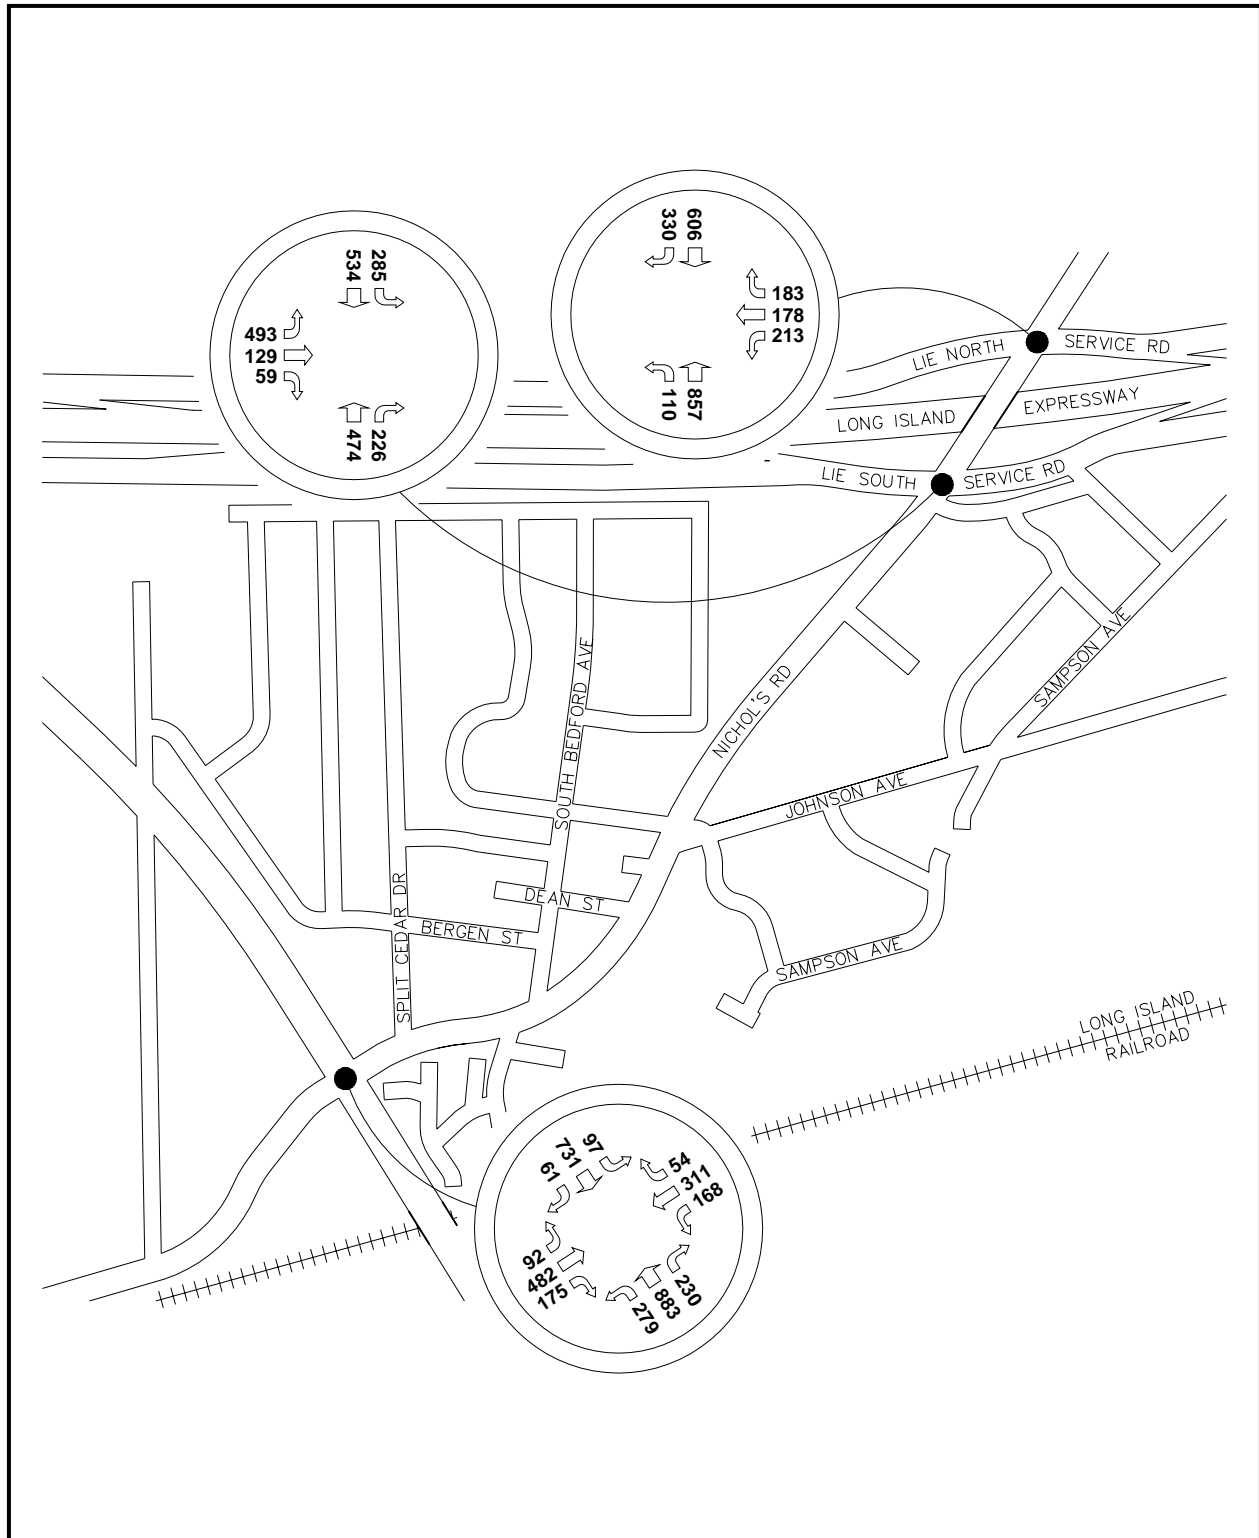

Figure 8: 2009 No Build Saturday Midday Peak Hour Traffic Volumes

PROPOSED DEVELOPMENT

Site Access

As depicted on the site plan, access to the site will be provided via one full movement driveway on Old Nichols Road in the vicinity of the existing access to the equestrian center on the site. As requested by the Village of Islandia, an alternative access off of Old Nichols Road via the existing Schley Place right-of-way was considered. These two driveway locations were analyzed from the standpoint of safety, location and design. Sight distance measurements were performed at both access points and compared with the recommendations contained in the reference, *A Policy on Geometric Design of Highways and Street* published in 2004 by the American Association of State Highway and Transportation Officials (AASHTO). It was determined from the review of the sight distance data that, the measured sight distances from both driveways will exceed the recommended sight distance criteria for left turn and right turn vehicles exiting the site. However the Schley Place right-of-way location will provide better sight lines for left turn vehicles exiting the site.

Parking

A total of 151 parking spaces (driveway and garage) will be provided for the 72 condominiums and 19 parking spaces will be provided for the 3,750 SF recreation building. The parking calculations as shown on the site plan indicate that 151 and 19 parking spaces are required to support the 72 condominiums and 3,750 SF Recreation building respectively in accordance with the Village of Islandia parking code. Therefore the parking requirements are met.

Trip Generation

In order to identify the impacts the proposed development will have on the adjacent street system, it is necessary to estimate the magnitude of traffic volume to be generated during the peak hours and to estimate the directional distribution of the site traffic when entering and exiting the subject property. As requested by the Village of Islandia, Nelson & Pope has conducted traffic counts at the Silver Woods condominium development similar to the proposed development located on Erhardt Way south of the proposed site in the Village of Islandia. The data was collected by means of manual turning movement counts at the driveway of the Silver

Woods development for the weekday AM (7-9AM) peak period, weekday PM (4-6PM) peak period and Saturday midday (11AM -2PM) peak period. Silver Woods contains 68 non-age restricted residential condominium units. The site data indicates rates of 0.41, 0.29 and 0.39 trips per unit during the weekday AM, PM and Saturday midday peak hours of the adjacent street respectively. Utilizing the Silver Woods trip generation rates, trip generation estimates were conducted for the proposed development. The following table summarizes the trips anticipated to be generated by the proposed 72 residential condominium units. The data collected at Silver Woods is included in Appendix B.

Table 5: Trip Generation estimates based on Silver Wood rates

Land Use	AM Peak Hour			PM Peak Hour			Saturday Peak Hour		
	Enter	Exit	Total	Enter	Exit	Total	Enter	Exit	Total
68 condominium units	6	22	28	13	7	20	14	12	26
<i>Trip generation rates (trips/unit)</i>	<i>0.09</i>	<i>0.32</i>	<i>0.41</i>	<i>0.19</i>	<i>0.10</i>	<i>0.29</i>	<i>0.21</i>	<i>0.18</i>	<i>0.39</i>
72 condominium units (based on Silver Woods trip generation rates)	7	23	30	14	7	21	15	13	28

Source: Traffic Counts collected at Silver Woods, Village of Islandia, NY

Trip generation estimate for the proposed residential development (47 age restricted and 25 non age restricted residential condominium units) was also prepared utilizing data found under Land Use Code 251-Senior Housing Detached and Land Use Code 230-Residential Condominium/Townhouse within the Institute of Transportation Engineers’ (ITE) publication, *Trip Generation, Seventh Edition*. This publication sets forth trip generation data obtained by traffic counts conducted at sites throughout the country. The following Table summarizes the trip generation estimates for the proposed project obtained from ITE. Appendix B contains the trip generation worksheets.

Table 6: Trip Generation estimates based on ITE

Time Period	Distribution	47 Senior Housing Units (ITE LUC 251)	25 Condominium/Townhouse Units (ITE LUC 230)	Total
Weekday AM Peak Hour	Enter	6	3	9
	Exit	9	14	23
	Total	15	17	32
Weekday PM Peak Hour	Enter	17	13	30
	Exit	11	6	17
	Total	28	19	47
Saturday Midday Peak Hour	Enter	6	27	33
	Exit	7	23	30
	Total	13	50	63

Source: Trip Generation, 7th Edition, published by ITE

As can be seen from Tables 5 and 6 above, the trip generation estimates from ITE are higher than those from the Silver Woods rates. In order to perform a conservative analysis the trip generation obtained from ITE was utilized in this study. It can be seen from Table 6 that, the proposed project will generate 32 trips (9 entering and 23 exiting) during the weekday AM peak hour, 47 trips (30 entering and 17 exiting) during the weekday PM peak hour and 63 trips (33 entering and 30 exiting) during the Saturday midday peak hour.

Trip Distribution and Assignment

The volume of site traffic that would travel through the study intersections during peak hours was distributed and assigned to each movement based on the existing roadway and travel patterns. The nature of the proposed land use and its associated travel patterns were considered as well. Figure 9 depicts the trip distribution for the proposed project. Figures 10, 11 and 12 depict the site generated volumes for the weekday AM, PM, and Saturday midday peak hours. The site generated volumes were then added to the weekday AM, PM and Saturday midday No Build Condition volumes resulting in the Build Condition volumes. The Build volumes are depicted in Figures 13, 14 and 15.

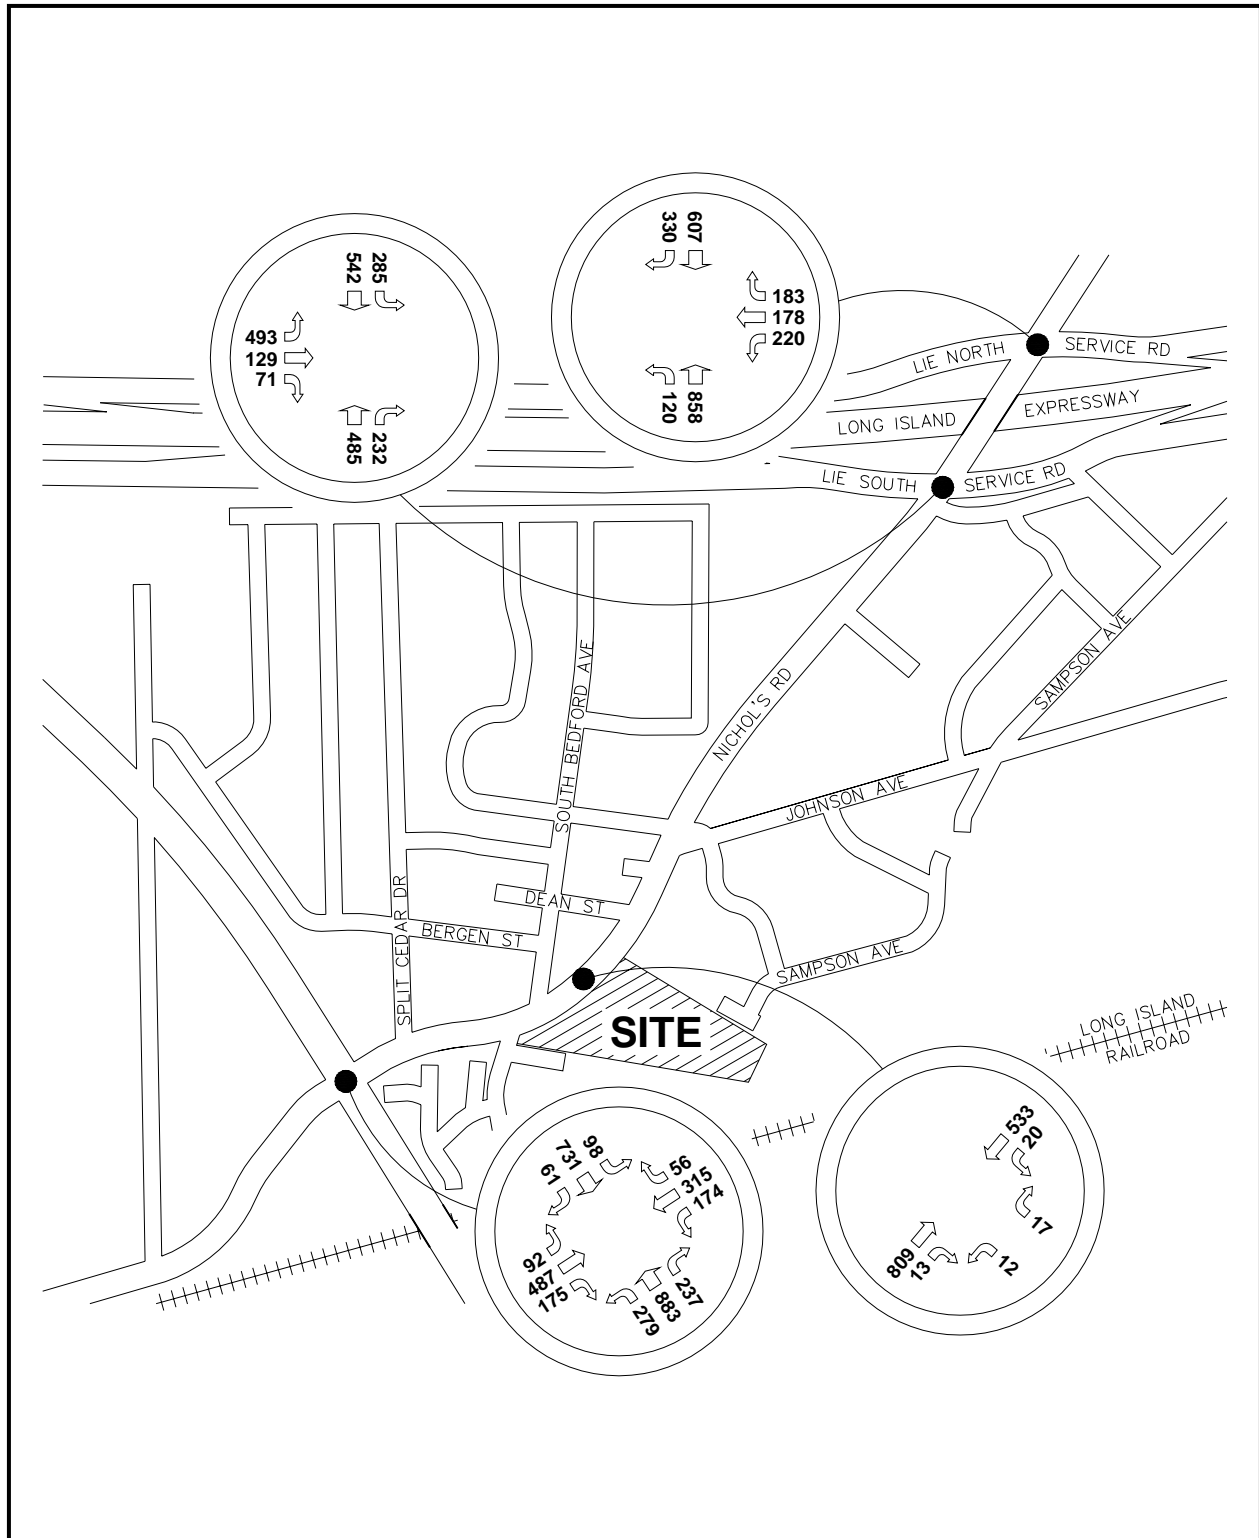

Figure 15: 2009 Build Saturday Peak Hour Traffic Volumes

TRAFFIC IMPACT ANALYSIS

As stated previously, the intersection capacity and level-of-service (LOS) analyses were based on the procedures and guidelines presented in the *HCM 2000*, published by the Transportation Research Board. The *HCS+*, Release 5.21 was used to analyze the study intersections and provide a LOS measurement of the intersections operation. The six classes of LOS, ranging from LOS A (excellent) to F (worst), are defined in Appendix C.

Table 7: Level of Service Summary (Signalized)

Signalized Intersections	Condition	AM Peak Hour		PM Peak Hour		Saturday Midday Peak Hour	
		LOS	Delay	LOS	Delay	LOS	Delay
Veterans Highway (NYS Route 454) at Old Nichols Road/East Suffolk Avenue (CR 100)	Existing	D	38.6	E	65.8	D	37.0
	No Build	D	40.0	E	72.1	D	37.8
	Build	D	40.4	E	72.6	D	37.8
Old Nichols Road at LIE South Service Road	Existing	B	20.0	D	45.8	B	19.8
	No Build	C	20.1	D	49.9	B	19.9
	Build	C	20.1	D	51.3	B	20.0
Old Nichols Road at LIE North Service Road	Existing	C	34.6	C	24.1	B	19.0

Notes: LOS = Level of Service, Delay = seconds/vehicle

Veterans Highway (NYS Route 454) at Old Nichols Road/East Suffolk Avenue (CR 100)

During the No Build Condition, the signalized intersection of Veterans Highway (NYS Route 454) at Old Nichols Road/East Suffolk Avenue (CR 100) will operate at LOS D, E, D during the weekday AM, PM and Saturday midday peak hours respectively. After the completion of the project, the intersection will continue to operate at No Build LOS conditions during the analyzed

peak periods. Therefore, no significant impacts are created and no mitigation measures are proposed at this intersection.

Old Nichols Road at LIE South Service Road

During the No Build Condition, the signalized intersection of Old Nichols Road at LIE South Service Road will operate at LOS C, D, B during the weekday AM, PM and Saturday midday peak hours respectively. After the completion of the project, the intersection will continue to operate at No Build LOS conditions during the analyzed peak periods. Therefore, no significant impacts are created and no mitigation measures are proposed at this intersection.

Old Nichols Road at LIE North Service Road

During the No Build Condition, the signalized intersection of Old Nichols Road at LIE North Service Road will operate at LOS D, C, B during the weekday AM, PM and Saturday midday peak hours respectively. After the completion of the project, the intersection will continue to operate at No Build LOS conditions during the analyzed peak periods. Therefore, no significant impacts are created and no mitigation measures are proposed at this intersection.

Old Nichols Road at Site Driveway

The site driveway analyses at any of the two locations considered will be the same since the traffic volumes will be same at either of these locations after the construction of the project. After the completion of the project, the southbound Old Nichols Road left turn movement at the intersection of Old Nichols Road and site driveway will operate at LOS A, B, and A during the weekday AM, PM and Saturday midday peak hours. The westbound site driveway approach will operate at LOS C, E and D during the weekday AM, PM and Saturday midday peak hours respectively.

TRAFFIC IMPACT OF CONSTRUCTION PHASE

Information obtained from the client indicates that, between 20 and 30 vehicles are anticipated to utilize the site per day during the peak phase of the construction period. Construction work will be done on a 7:00 AM to 3:00 PM shift, meaning most of the workers will be on site on or before 7:00 AM (before the AM peak hour) and will vacate the site before the PM peak hour. The traffic anticipated to be generated by the proposed project as shown in the traffic study is higher than the number of vehicles anticipated utilizing the site during construction. It is our opinion that the construction phase will not significantly impact the operation of the roadways in the vicinity of the site since the findings of the traffic impact study indicated the same for the traffic generated by the project after construction.

CONCLUSION

Nelson & Pope has investigated the potential traffic impacts associated with the proposed Residential development “The Preserve at Islandia” to be located on the eastside of Old Nichols Road south of Deans Street in the Village of Islandia, Town of Islip, Suffolk County, New York. The proposed residential development will be located on a parcel of land designated as District 504, Section 17, Block 03, Lots 7 & 8 on the Suffolk County Tax maps and comprised of a total of 72 Residential Condominium units (47 age restricted units and 25 non age restricted units). The site currently contains an Equestrian Center. The following is a summary of this investigation and the findings thereof:

1. The following intersections were studied:
 - Veterans Highway (NYS Route 454) at Old Nichols Road/East Suffolk Avenue (CR 100)
 - Old Nichols Road at Long Island Expressway (LIE) South Service Road
 - Old Nichols Road at Long Island Expressway (LIE) North Service Road
2. Existing volumes were counted in November 2007. Future No Build traffic volumes were determined by applying a 1.2% NYSDOT annual growth factor to the existing traffic volumes. The site-generated traffic was estimated and distributed to the study intersections and then added to the No Build traffic volumes to generate the future Build traffic volumes.
3. The proposed Residential development is projected to generate 32 trips during the AM peak hour (9 entering, 23 exiting), 47 trips during the PM peak hour (30 entering, 17 exiting) and 63 trips during the Saturday midday peak hour (33 entering, 30 exiting).
4. As depicted on the site plan, access to the proposed development will be provided via one full movement driveway on Old Nichols Road.
5. Capacity analyses were conducted at all the study intersections during the weekday AM, weekday PM and Saturday midday peak hours.
6. After the completion of the project all the study intersections will continue to operate at No Build LOS during the weekday AM, PM and Saturday midday peak hours.

7. The traffic anticipated to be generated during the construction phase will be less than the traffic anticipated to be generated by the proposed project after construction. Therefore the traffic from the construction phase will not significantly impact the operation of the roadways in the vicinity of the site since the findings of the traffic impact study indicated the same for the traffic generated by the project after construction.

Based on the results of the Traffic Impact Study as detailed in the body of this report, it is the professional opinion of Nelson & Pope that, the construction of proposed Residential development will not result in an adverse traffic impact at the study intersections.

The Preserve at Islandia

TOWN OF ISLIP

TRIP GENERATION BY MICROTRANS

Appendix C: Level of Service Definitions

LEVEL OF SERVICE: SIGNALIZED INTERSECTIONS

Level of service for signalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. The levels of service range between level of service A (relatively congestion-free) and level of service F (congested).

The delay experienced by a motorist is made up of a number of factors that relate to control, geometry, traffic, and incidents at an intersection. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during ideal conditions: in the absence of traffic control, in the absence of geometric delay, in the absence of any incidents, and when there are no other vehicles on the road. The portion of the total delay attributed to the control facility is called the control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. Control delay may also be referred to as signal delay for signalized intersections.

Level of service criteria for signalized intersections is determined in terms of the average control delay per vehicle. The following average control delays are used to determine approach levels of service:

Level of Service A	≤ 10.0 seconds per vehicle
Level of Service B	> 10.0 and ≤ 20.0 seconds per vehicle
Level of Service C	> 20.0 and ≤ 35.0 seconds per vehicle
Level of Service D	> 35.0 and ≤ 55.0 seconds per vehicle
Level of Service E	> 55.0 and ≤ 80.0 seconds per vehicle
Level of Service F	> 80.0 seconds per vehicle

Level of Service A describes operations with very low control delay. This occurs when progression is extremely favorable; most vehicles arrive during the green phase and do not stop at all. Short traffic signal cycles may contribute to low delay.

Level of Service B generally occurs with good progression and/or short traffic signal cycle lengths. More vehicles stop than for level of service A, causing higher average delays.

Level of Service C has higher delays than level of service B. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures, where motorists are required to wait through an entire signal cycle, may begin to appear at this level. The number of vehicles stopping is significant, although many still pass through the intersection without stopping.

Level of Service D At this level, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths or high volume-to-capacity ratios. The proportion of stopping vehicles increases. Individual cycle failures are noticeable.

Level of Service E is considered the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths and high volume-to-capacity ratios. Individual cycle failures occur frequently.

Level of Service F is considered unacceptable to most drivers. This condition often occurs with over saturation, i.e., when arrival flow rates exceed the capacity of the intersection. It may occur at volume to capacity ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

LEVEL OF SERVICE: TWO WAY STOP CONTROLLED INTERSECTIONS

The quality of traffic service at a two-way stop controlled, or "TWSC," intersection is measured according to the level of service and capacity of individual legs. The level of service ranges from LOS A to LOS F, just as with signalized intersections.

The right of way at the TWSC intersection is controlled by stop signs on two opposing legs of an intersection (on one leg of a "T"-type intersection). The capacity of a controlled leg is based on the distribution of gaps in the major street traffic flow, driver judgment in selecting a gap through which to execute the desired maneuver and the follow up time required by each driver in a queue.

The level of service for a TWSC intersection is determined by the computed or measured control delay and is defined for each minor movement. Level of service is not defined for the intersection as a whole. The delay experienced by a motorist is made up of a number of factors that relate to control, geometry, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during conditions with ideal geometry and in the absence of incidents, control, and traffic. This program only quantifies that portion of the total delay attributed to traffic control measures, either traffic signals or stop signs. This delay is called control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration. Average control delay for any particular minor movement is a function of the approach and the degree of saturation.

The expectation is that TWSC intersections are designed to carry smaller traffic volumes than signalized intersections. Therefore, the delay threshold times are lower for the same LOS grades. The following average control delays are used to determine approach levels of service:

Level of Service A	≤ 10 seconds per vehicle
Level of Service B	> 10 and ≤ 15 seconds per vehicle
Level of Service C	> 15 and ≤ 25 seconds per vehicle
Level of Service D	> 25 and ≤ 35 seconds per vehicle
Level of Service E	> 35 and ≤ 50 seconds per vehicle
Level of Service F	> 50 seconds per vehicle

CAPACITY AND LOS WORKSHEET

General Information

Project Description *THE PRESERVE @ ISLANDIA: 07246*

Capacity Analysis

Lane Group	EB			WB			NB			SB		
				L	TR		L	T			T	R
Adjusted Flow Rate				253	352		122	874			653	353
Satflow Rate				3437	4756		3437	3547			5074	1583
Lost Time				2.0	2.0		2.0	2.0			2.0	2.0
Green Ratio				0.33	0.33		0.14	0.51			0.30	0.30
Lane Group Capacity				1146	1585		467	1807			1502	469
v/c Ratio				0.22	0.22		0.26	0.48			0.43	0.75
Flow Ratio				0.07	0.07		0.04	0.25			0.13	0.22
Critical Lane Group				N	Y		Y	N			N	Y
Sum Flow Ratios	0.33											
Lost Time/Cycle	17.60											
Critical v/c Ratio	0.43											

Lane Group Capacity, Control Delay, and LOS Determination

Lane Group	EB			WB			NB			SB		
				L	TR		L	T			T	R
Adjusted Flow Rate				253	352		122	874			653	353
Lane Group Capacity				1146	1585		467	1807			1502	469
v/c Ratio				0.22	0.22		0.26	0.48			0.43	0.75
Green Ratio				0.33	0.33		0.14	0.51			0.30	0.30
Uniform Delay d_1				18.0	18.0		29.0	12.0			21.3	23.9
Delay Factor k				0.50	0.50		0.11	0.11			0.11	0.31
Incremental Delay d_2				0.4	0.3		0.3	0.2			0.2	6.8
PF Factor				1.000	1.000		1.000	1.000			1.000	1.000
Control Delay				18.4	18.3		29.3	12.2			21.5	30.7
Lane Group LOS				B	B		C	B			C	C
Approach Delay				18.4			14.3			24.7		
Approach LOS				B			B			C		
Intersection Delay	19.3			Intersection LOS						B		

TWO-WAY STOP CONTROL SUMMARY

General Information		Site Information	
Analyst	MCM	Intersection	SITE ACCESS @ NICHOLS ROAD
Agency/Co.	NELSON & POPE	Jurisdiction	
Date Performed	11/26/2007	Analysis Year	2009
Analysis Time Period	AM BUILD 2009		

Project Description THE PRESERVE AT ISLANDIA: 07246	
East/West Street: SITE ACCESS	North/South Street: NICHOLS ROAD
Intersection Orientation: North-South	Study Period (hrs): 0.25

Vehicle Volumes and Adjustments

Major Street Movement	Northbound			Southbound		
	1 L	2 T	3 R	4 L	5 T	6 R
Volume (veh/h)		540	3	5	851	
Peak-Hour Factor, PHF	1.00	0.98	0.98	0.91	0.91	1.00
Hourly Flow Rate, HFR (veh/h)	0	551	3	5	935	0
Percent Heavy Vehicles	0	--	--	2	--	--
Median Type	Undivided					
RT Channelized			0			0
Lanes	0	1	0	0	1	0
Configuration			TR	LT		
Upstream Signal		0			0	

Minor Street Movement	Eastbound			Westbound		
	7 L	8 T	9 R	10 L	11 T	12 R
Volume (veh/h)				10		14
Peak-Hour Factor, PHF	1.00	1.00	1.00	0.90	1.00	0.90
Hourly Flow Rate, HFR (veh/h)	0	0	0	11	0	15
Percent Heavy Vehicles	0	0	0	2	0	2
Percent Grade (%)	0			0		
Flared Approach		N			N	
Storage		0			0	
RT Channelized			0			0
Lanes	0	0	0	0	0	0
Configuration					LR	

Delay, Queue Length, and Level of Service

Approach	Northbound	Southbound	Westbound			Eastbound		
			7	8	9	10	11	12
Movement	1	4						
Lane Configuration		LT		LR				
v (veh/h)		5		26				
C (m) (veh/h)		1016		236				
v/c		0.00		0.11				
95% queue length		0.01		0.37				
Control Delay (s/veh)		8.6		22.1				
LOS		A		C				
Approach Delay (s/veh)	--	--		22.1				
Approach LOS	--	--		C
