1.0
Introduction

This revised document is an Expanded Environmental Assessment (Expanded EA) for the proposed application of Delaware North Islandia Properties, LLC, as successor-in-interest to Delaware North Companies Parks & Resorts, Inc. (hereinafter "Delaware North, "DNC" or "Applicant,") for a special permit for an accessory video lottery gaming facility at the Marriott Hotel. Specifically, the proposed action would require interior construction and reallocation of space in the existing hotel to accommodate an accessory indoor amusement establishment at the existing Islandia Marriott Long Island Hotel at 3635 Express Drive North, in the Incorporated Village of Islandia, Suffolk County, New York (hereinafter "the subject property"). The subject property is 7.88± acres in size and is currently developed with a 278-room (including 13 suites) hotel and associated parking lot (649 parking spaces) (see Figure 1). The subject property is at the northeast corner of Bedford Avenue and Express Drive North, west of Dawson Court, and south of Kosciusko Street. The subject property is designated on the Suffolk County Tax Map (SCTM) as Section 008 - Block 2 – Lot 58.2 (see Figure 2).

This Expanded EA addresses the relevant environmental and planning issues and potential impacts identified during the preparation of the Part 1 - EAF, as follows:

- Land Use and Zoning
- Transportation and Parking
- Public Need and Benefits

This document is divided into three sections. The first, of which this is a part, is the introduction to the proposed project. The second part contains a summary of the existing site conditions and a detailed description of the proposed project. The third section of this Expanded EA includes a discussion of the aforementioned potential impacts.

2.0
Description of Proposed Action

2.1 Existing Site Conditions

The proposed action consists of an application for a special permit for an accessory video lottery gaming facility at the Islandia Marriott Long Island Hotel (hotel) to permit an accessory use therein. The subject property is currently developed with a 216,650±-square-foot (sf) 278-room hotel (including 13 suites), with meeting rooms, a pool, bar and restaurant, fitness room, and associated parking areas, on 7.88±acres at 3635 Express Drive North, in the Incorporated Village of Islandia, Suffolk County, New York.[1]

Access to the subject property is currently provided by three driveways -- Express Drive North on the south, Bedford Avenue on the west, and Kosciusko Street on the north.

The existing hotel parking area contains 649 parking spaces with landscaped islands. See Figure 3 for an aerial photograph of the site and surrounding area, and Append A for site and surrounding area photographs.

Sewage disposal for the hotel is via connection to Suffolk County Sewer District #13-Windwatch. Water supply is from the Suffolk County Water Authority (SCWA).

The subject property is within both the Central Islip and Hauppauge Union Free School Districts. Fire protection is provided by both the Hauppauge and Central Islip Fire Departments, emergency medical services are provided by the Central Islip-Hauppauge Volunteer Ambulance, and police protection is provided by the Suffolk County Police Department, Fourth Precinct.

[1] It should be noted that the Village of Islandia provided the original site plan to the applicant, which indicates that existing conditions (e.g., number of parking spaces and guest rooms) differs from the original permitted conditions. The applicant and its consultants cannot explain the difference in the information, as they had no prior relationship or involvement with the Marriott Hotel.

2.2 Proposed Action

The proposed action consists of an application for a special permit for an accessory video lottery gaming facility at the hotel that would consist of a Video Lottery Terminals (VLTs) facility, Suffolk Off Track Betting (OTB) simulcast location, food and beverage locations, and back-of-house support areas for the operator of the hotel. The proposed VLT and OTB simulcast would be an accessory and complimentary use to the existing hotel. As previously described, the subject property is developed with the Islandia Marriott Long Island Hotel, which is equipped with 278 guest rooms (13 of which are suites) and associated parking.

Proposed modifications to the existing hotel would primarily be interior reallocation of spaces. Specifically, 2 suites and 31 guest rooms, existing meeting rooms, banquet rooms, and the pool would be replaced with approximately 30,255 sf of gaming area for the VLTs and two Suffolk OTB quick-bet kiosks, as well as additional VLT offices and support areas and OTB offices. Square footage dedicated to support services (e.g., kitchen, housekeeping and lobby) would be generally consistent with current conditions. The proposed gaming area (accessory use to the hotel) would occupy a nominal 13.9± percent of the overall 216,650sf hotel.

As previously described, the subject property contains 649 parking spaces, which are sufficient to accommodate the existing hotel operations and the proposed accessory use. There is one modification proposed at the northeast corner of the building to allow for a sally port, or secure entry to the building. This modification would eliminate six parking spaces from the existing parking lot, resulting in a total of 643 parking spaces on-site. It should be noted, however, that the sally port would be within the existing building footprint – enclosing an existing overhang area.

It should be noted that the original Expanded EA, dated June 2016, indicated that the proposed accessory use would be implemented in two phases, the second phase of which would require an off-site or satellite parking area. The proposed action is now only one phase and no longer requires off-site parking. The applicant's architect, SOSH NY, has demonstrated that a portion of the existing parking area can be allocated for valet parking. As such, all parking would be contained on-site and no off-site parking is required. The separate Traffic Impact Study, which was also revised, is included in Appendix B of this Expanded EA, and provides further discussion of the valet parking operation.

Sewage disposal for the existing hotel is handled via connection to the existing sewer main, located on Bedford Avenue, which then connects to the Suffolk County Municipal Sewer District #13 - Windwatch. Design flow was analyzed using current Suffolk County Department of Public Works (SCDPW) and Suffolk County Department of Health Services (SCDHS) design flow criteria, which resulted in a

current design flow of 43,853 gallons per day (gpd), based on current conditions (i.e., rooms, restaurant, catering, etc.). The design flow for the proposed VLT operation, accounting for the remaining rooms, removal of catering facilities, etc., resulted in a design flow of 39,590[2] gpd, which is less than the allocated flow of 56,000 gpd that the hotel was allotted when the district #13 – Windwatch was created. As such, there are no permits or approvals required from the SCDPW or SCSA for the proposed action.

Presently, a 12-inch Suffolk County water main runs along the south side of Kosciusko Street, directly adjacent to and north of the subject property. Water to the subject property would continue to be supplied by the SCWA. No additional permits or approvals would be required.

Stormwater runoff is currently collected in catch basins, area inlets, and drywells equipped with inlet structures located throughout the parking areas. As there is no ground disturbance or increase in impervious surface proposed, a Storm Water Pollution Prevention Plan (SWPPP) is not required for the proposed action.

As noted, the subject property is within both the Central Islip and Hauppauge Union Free School Districts. Fire protection is provided by both the Hauppauge and Central Islip Fire Departments and police protection is provided by the Suffolk County Police Department. Emergency medical services are provided by the Central Islip-Hauppauge Volunteer Ambulance Corps.

2.2.1 Required Permits and Approvals

In order to implement the proposed action, the following permits and approvals are required.

Table 1 - Required Permits and Approvals

AGENCY	PERMIT OR APPROVAL
Incorporated Village of Islandia Board of Trustees	Special Permit for an Accessory Video Lottery Gaming Facility
Suffolk County Planning Commission	Referral - Special Permit
New York State Gaming Commission	

[2] It should be noted that the original Expanded EA, dated June 2016, estimated sanitary wastewater at 40,328 gpd existing, and 39,750 gpd proposed. Further clarification of interior spaces and modifications thereto resulted in the revised totals above.

3.0

Impact Issues

3.1 Land Use, Zoning and Comprehensive Plan Analysis

3.1.1 Land Use and Zoning

As previously explained, the subject property, which is approximately 7.88 acres, is developed with the Islandia Marriott Long Island Hotel and associated parking areas. The property is bordered on the south by Express Drive North; on the west by Bedford Avenue; on the north by Kosciusko Street, and on the east by undeveloped land and single-family homes on Dawson Court.

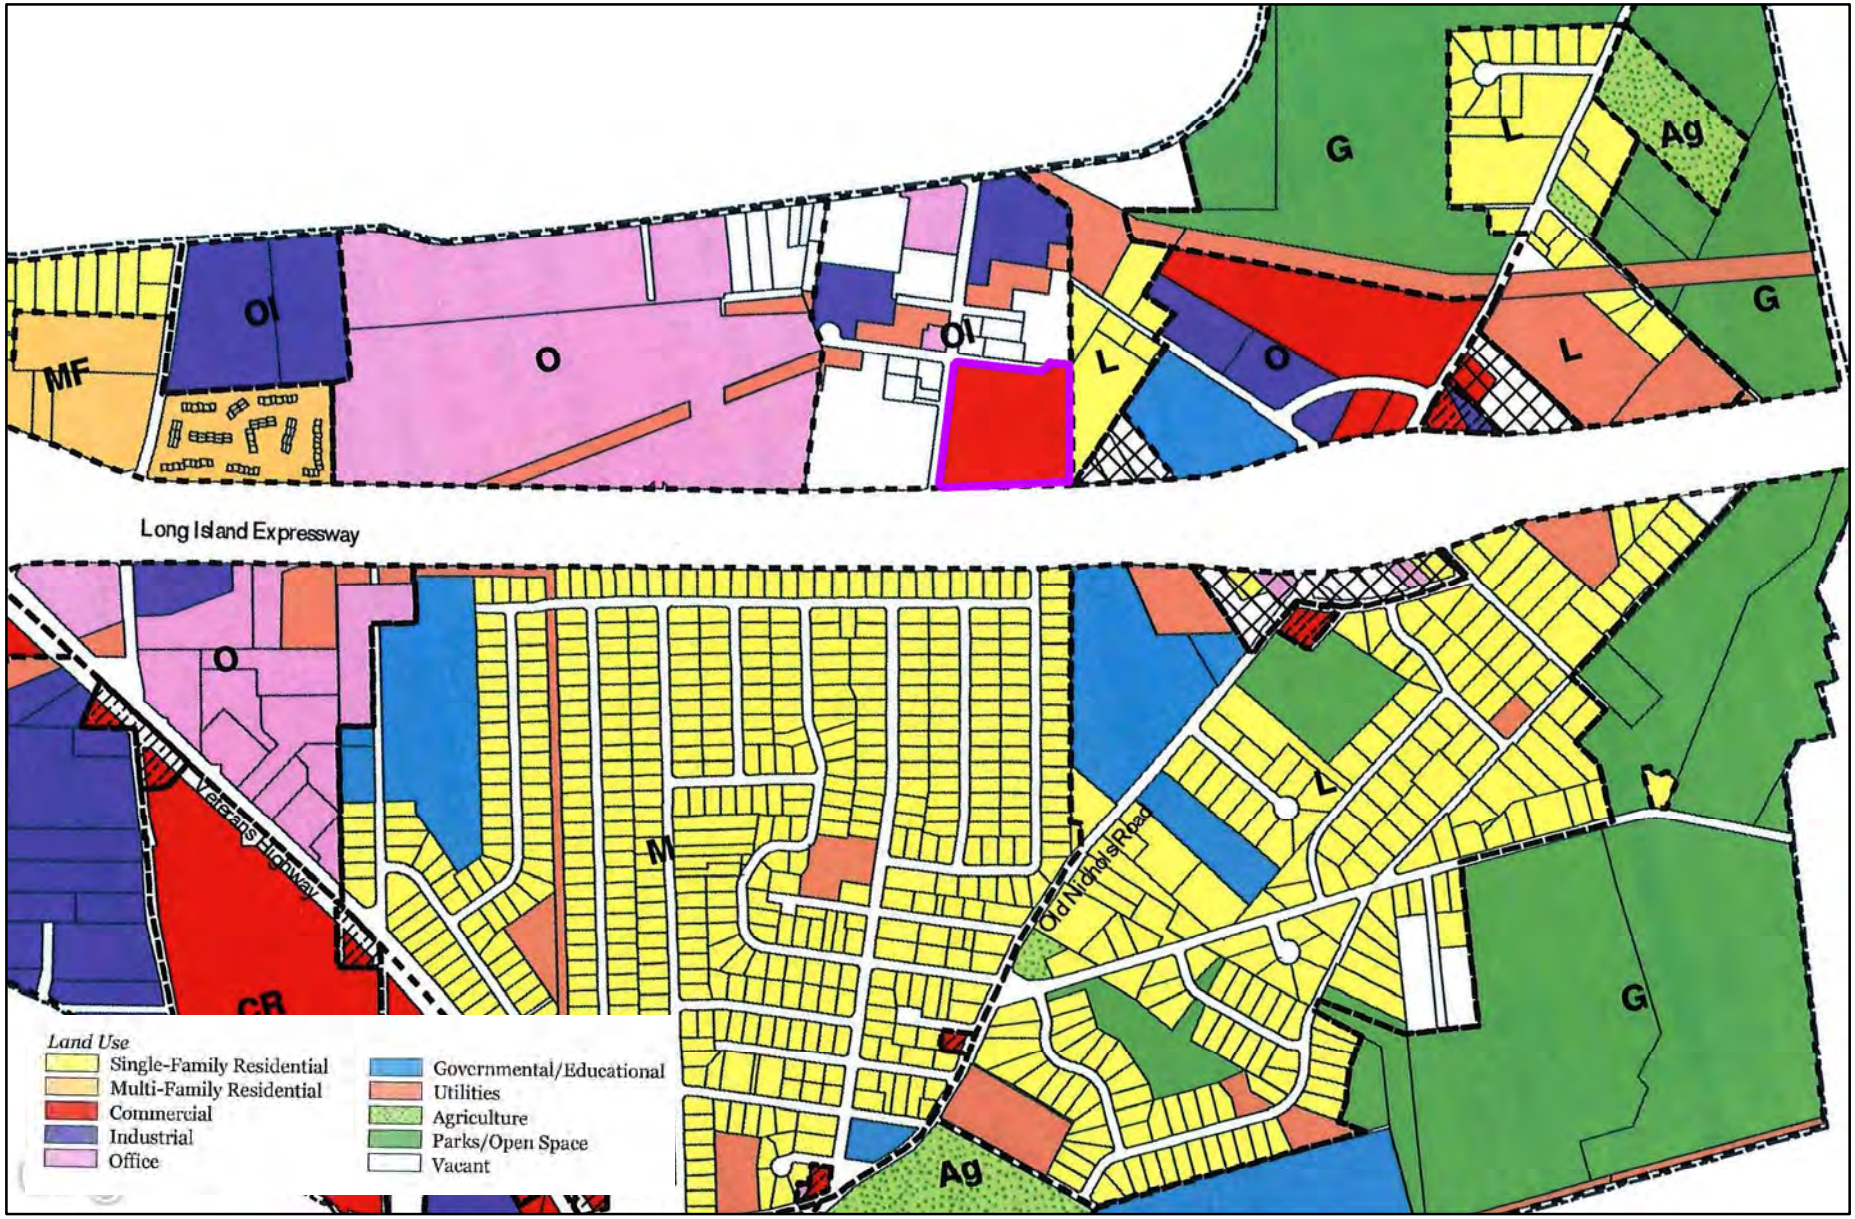

A description of the land uses and zoning adjoining and surrounding the subject property follows. See Figure 4, and Appendix A of this Expanded EA, for site and surrounding area photographs.

North: Directly north of the subject property is Kosciusko Street, followed by undeveloped properties, a PSEG Long Island right-of-way and Whitson's distribution facility. Beyond that is Motor Parkway, which serves as the Village of Islandia boundary. The properties in this area are all in the Office Industry (OI) zoning district of the Village of Islandia.

East: East of the subject property are undeveloped lands, single-family residences on Dawson Court and Shafter Street, a New York State Department of Transportation (NYDOT) Park & Ride and then Shafter Street, which is developed with industrial uses. These properties are located within the Low Density Residence (L) and Office (O) zoning districts.

South: Immediately south of the subject property is Express Drive North and the Long Island Expressway. South of the Long Island Expressway is residential development in the Medium Density (M) zoning district.

West: Immediately west of the subject property is Bedford Avenue followed by undeveloped land, beyond which is CA Technologies. This area is designated OI and O on the Village of Islandia Zoning Map.

Figure 4 - Zoning Map

Legend

Subject Property

vhb

As can be seen in Figure 3, and in the photographs included in Appendix A, the predominant land use in this area is industrial and commercial.

From a land use perspective, the proposed special permit for an accessory video lottery gaming facility at the hotel would not be discernible from the surrounding area. The overall use of the property would not change, and only one small exterior modification, which would not increase the building footprint, to the remote northeast corner of the hotel is necessary, with the most of the modifications taking place within the building. The hotel is a place where it is expected people would congregate, and the same would be true upon the completion of the proposed action. As previously indicated, and discussed below, the zoning designation of the subject property permits the hotel, by special permit from the Village Board of Trustees, as well as the surrounding commercial and industrial uses. Moreover, surrounding land uses have been well-established, as is the subject property, which has been developed with a hotel for over 30 years. Thus, the approval of an accessory indoor amusement use at the subject property, with minimal exterior modifications and which would involve the congregation of people, consistent with current conditions, would not alter the existing land use, or have significant adverse impacts on the surround land uses.

Zoning

The subject property is within the Village of Islandia's OI zoning district, which permits, among other uses, offices, assembly and social recreation hall, and restaurants and eating and drinking establishments. Hotels are permitted by special permit granted by the Village Board, after a public hearing.

Pursuant to Chapter 177-76.D., "Whenever a use has been authorized by a special permit, no accessory use shall be permitted unless the same shall have been specifically authorized by that board that authorized the use." As the Islandia Marriott Long Island operates under a special permit granted by the Village Board of Trustees, the proposed accessory indoor amusement use must also receive approval from the Village of Islandia Board of Trustees.

The Village of Islandia Code (Code) sets forth criteria for the issuance of special permits by the Board of Appeals, not the Board of Trustees. However, the following consistency analysis with such criteria, is presented to demonstrate the appropriateness of the proposed accessory indoor amusement use to the existing hotel.

§ 177-109. Special Permit Determination.

> *Before such approval for such special exception, the Board of Appeals shall determine that:*

A. *The use shall not prevent the orderly and reasonable use of adjacent properties or of properties in adjacent use districts.*

The subject property is developed with the Islandia Marriott Long Island Hotel, which would not change as a result of the proposed special permit for the accessory video lottery gaming facility. Existing interior spaces would be modified to accommodate this use, and as such, would not prevent the orderly and reasonable use of permitted or legally established uses in the district. The conversion of an existing overhang to an enclosed sally port, in the northeast corner or the building, would not increase the building footprint.

Based on information provided by the applicant, it is anticipated that peak hours of activity associated with the indoor amusement area would be evenings and weekends, which is similar to the peak hours of use for the existing hotel. As discussed elsewhere in this Expanded EA, and in the revised Traffic Impact Study (TIS) (see Appendix B), the applicant's architect has determined that a portion of the existing parking area would be dedicated to valet parking and, as such, anticipated parking demands would be accommodated on-site. A previously-considered off-site parking area is no longer proposed or required. Moreover, the proposed accessory use to the hotel would occupy approximately 13.9 percent of the overall 216,650±-sf hotel. As such, the proposed accessory indoor amusement would not prevent the orderly and reasonable use of adjacent properties or of properties in adjacent use districts.

B. *The use shall not prevent the orderly and reasonable use of permitted or legally established uses in the district wherein the proposed use is to be located or of permitted or legally established uses in adjacent use districts.*

As previously discussed, the proposed accessory use to the Islandia Marriott Long Island Hotel would be an indoor amusement area that would be complimentary and harmonious with the existing hotel use. Existing interior spaces would be modified to accommodate this use, and as such, would not prevent the orderly and reasonable use of permitted or legally established uses in the district. The conversion of an existing overhang to an enclosed sally port, in the northeast corner or the building, would not increase the building footprint.

Based on information provided by the applicant, it is anticipated that peak hours of activity associated with the indoor amusement area would be evenings and weekends, which is similar to the peak hours of use for the existing hotel. Meeting and banquet spaces would be replaced by the proposed indoor amusement area; thereby, reducing the number of events the hotel could accommodate. The increase in visitation that

would result from the proposed accessory indoor amusement use would be partially accounted for by the reduction in events and/or functions held in the meeting and banquet spaces. Also, as previously discussed, the surrounding area is developed primarily with office/commercial and industrial uses, proximate to major transportation corridors (i.e., the Long Island Expressway and Motor Parkway). Thus, the proposed accessory use would not prevent the orderly and reasonable use of permitted or legally established uses in the district.

C. *The safety, health, welfare, comfort, convenience or order of the Village shall not be adversely affected by the proposed use and its location.*

As discussed throughout this Expanded EA, the proposed accessory use is complimentary and harmonious with the existing hotel use on the subject property. Modifications to interior spaces within the hotel would accommodate the accessory use and support activities associated therewith (e.g., VLT offices, OTB office). All modifications would be done in accordance with applicable building codes, and in consultation with Village officials and staff to ensure there are no safety concerns. The location of the existing hotel, on the north service road of the Long Island Expressway, provides convenient access to the subject property, while minimizing potential impacts to the Village's roadways (also see Section 3.2 of this Expanded EA). Therefore, the safety, health, welfare, comfort, convenience and order of the Village would not be adversely affected by the proposed accessory use and its location in the existing hotel.

D. *The use shall be in harmony with and promote the general purposes and intent of this chapter.*

The proposed accessory use to the existing hotel would be in harmony with the existing hotel use, as well as the general purposes and intent of this chapter. Specifically, § 177-71.B. of the Code states:

> *The intent of the Office/Industry District is to continue the orderly mixed-use development consisting of high quality, nonintensive light industrial and warehouse uses along with the office development in accordance with appropriate standards of design and site development.*

The existing hotel is a suitable, appropriate, and harmonious location for the accessory indoor amusement use, in that most of the modifications proposed are to interior spaces of the building, with one minor change to the exterior of the building that would not increase the building footprint. The surrounding area is mostly developed with commercial and industrial uses. The existing hotel is conveniently located on Express

Drive North, adjacent to the Long Island Expressway, and as such, would have minimal potential impacts to local/Village roadways.

§ 177-110. Special Permit Considerations.

In making a determination for a special permit approval, the Board of Appeals[3] shall, among other things, give consideration to the following:

A. *The character of the existing and probable development of uses in the district and the peculiar suitability of such district for the location of any such permissive uses.*

The proposed accessory use to the existing hotel would not result in any substantial or noticeable exterior alterations to the building or subject property. The accessory indoor amusement use is complimentary and harmonious with the existing hotel use, which is located in the OI zoning district, and permitted by special permit granted by the Village Board of Trustees. The hotel has been operating on this property for approximately 30 years and the surrounding area is primarily designated for and developed with office and industrial uses.

B. *The conservation of property values and the encouragement of the most appropriate uses of land.*

The subject property has been developed with the hotel, and has been in operation since circa mid-1980s, as have many of the surrounding commercial and/or industrial uses. The only exterior modification to the building proposed is in the northeast corner of the building, and would not be discernible from the surrounding area.

Based on information provided by the applicant, it is anticipated that peak hours of activity associated with the indoor amusement area would be evenings and weekends, which is similar to the peak hours of use for the existing hotel. Meeting and banquet spaces would be replaced by the proposed indoor amusement area; thereby, reducing the number of events the hotel could accommodate. The increase in visitation that would result from the proposed accessory indoor amusement use would be partially accounted for by the reduction in events and/or functions held in the meeting and banquet spaces. As such, the neighborhood character has been established and would not change as a result of the proposed accessory indoor amusement to the existing hotel.

[3] As previously indicated, the instant application is subject to approval from the Village Board of Trustees. The Code, however, sets forth criteria referencing only the Board of Appeals. A consistency analysis with this criteria is provided to demonstrate the appropriateness of the proposed accessory use to the existing hotel.

C. *The effect that the location of the proposed use may have upon the creation of undue increase of vehicular traffic congestion on public streets, highways or waterways.*

As discussed in Section 3.2 of this Expanded EA, and in the TIS (see Appendix B), given that the hotel is existing, and located on Express Drive North, it is not expected that the proposed accessory use to the hotel would cause the creation of undue vehicular traffic that would create congestion on public streets or highways.

D. *The availability of adequate and proper public or private facilities for the treatment, removal or discharge of sewage, refuse or other effluent (whether liquid, solid, gaseous or otherwise) that may be caused or created by or as a result of the use.*

As previously discussed, the existing hotel is generating less sanitary flow than was allocated to it when Sewer District #13 – Windwatch was created. The number of rooms in the hotel would be reduced by 33, and the type of wastewater flow is not proposed to change. The total estimated wastewater flow for the hotel and the accessory indoor amusement area, would be approximately 39,590 gpd, and would continue to be handled by existing connections to Sewer District #13.

E. *Whether the use or materials incidental thereto or produced thereby may give off obnoxious gases, odors, smoke or soot.*

The proposed accessory indoor amusement area, complimentary to the existing hotel, would not use or produce materials that would give off obnoxious gases, odors, smoke or soot. As previously discussed, interior spaces would be modified and reallocated to accommodate areas for the VLTs and associated support services. There is no manufacturing or industrial use occurring or proposed on the subject property.

F. *Whether the use shall cause disturbing emission of electrical discharges, dust, light, vibration or noise.*

As previously discussed, the accessory indoor amusement use would be complimentary to the existing hotel. There is no manufacturing or industrial use occurring or proposed on the subject property. Primarily interior modifications are proposed, with one exterior modification enclosing an existing overhang, which would not increase the building footprint. As such, there would be no disturbing emission of electrical discharges, dust, light, vibration or noise.

G. *Whether the operations in pursuance of the use shall cause undue interference with the orderly enjoyment by the public of parking or of recreational facilities if existing or if proposed by the Village or by other competent governmental agency.*

The subject property is developed with the existing Islandia Marriott Long Island Hotel and associated parking areas, which provides parking for 649 vehicles, which would be reduced by six spaces, as a result of the proposed action. As discussed in the *Land Use* section of this Expanded EA, the surrounding properties are developed with primarily industrial and commercial uses, along Express Drive North. There are on-street parking restrictions posted on the west side of Bedford Avenue only. As previously discussed, based on information provided by the applicant, it is anticipated that peak hours of activity associated with the indoor amusement area would be evenings and weekends, which is similar to the peak hours of use for the existing hotel. A portion of the existing parking area would be dedicated to valet parking, which would enable the applicant to accommodate anticipated peak parking demands on-site, by utilizing the parking area more efficiently and accommodating more vehicles in the same area.

It is respectfully submitted that the operations of the accessory use would not cause undue interference with or the orderly enjoyment by the public of parking or recreational facilities. As discussed in Section 3.3 of this Expanded EA, it is noted that guests of the hotel may want to use other Village recreational facilities and resources during a stay at the hotel. However, it is not expected that any interference would be caused by such visits.

H. *The necessity for bituminous-surfaced space for purposes of off-street parking of vehicles incidental to the use and whether such space is reasonably adequate and appropriate and can be furnished by the owner of the plot sought to be used within or adjacent to the plot wherein the use shall be had.*

As discussed in Section 3.2 of this Expanded EA, and in the TIS in Appendix B of this Expanded EA, upon completion of the proposed action, the existing parking would be reduced by six spaces (from 649 to 643). While this level of parking still exceeds Village Code by 170 spaces, the proposed accessory use does not lend itself to direct application of the Village Code in determining parking sufficiency, which is discussed in greater detail in the TIS in Appendix B. The conservative estimate of peak parking demands included in the TIS indicate an approximate peak need of between 750 and 800 parking spaces. The project architect has developed a valet parking plan, which would allow the site to accommodate up to 827 parking spaces. The western portion of the

existing parking area would be allocated for valet-parked vehicles. As such, the proposed action is consistent with this criterion.

I. *Whether a hazard to life, limb or property because of fire, flood, erosion or panic may be created by reason or as a result of the use or by the structures to be used therefore or by the inaccessibility of the property or structures thereon for the convenient entry and operation of fire and other emergency apparatus or by the undue concentration or assemblage of persons upon such plot.*

As previously discussed, the subject property is developed with the hotel and associated parking areas, with minimal changes proposed. There are three access points to the property; Express Drive North, Bedford Avenue, and Kosciusko Street. There is sufficient maneuverability within the subject property for emergency vehicles. Interior spaces, such as meeting rooms, the pool and banquet spaces, would be reallocated to accommodate the accessory indoor amusement use. Thus, there would not be an undue concentration or assemblage of persons, in accordance with permitted maximum occupancies that would be posted and enforced. Moreover, as the only exterior modification would be to enclose an existing overhang area, which would not increase the building footprint, there would be no risk of erosion. There would be no hazards to life, limb or property because of fire, flood, erosion or panic created as a result of the proposed accessory use to the existing hotel.

J. *Whether the use or the structures to be used therefore shall cause an overcrowding of land or undue concentration of population.*

The subject property is developed with a hotel and associated parking areas. There are no new structures proposed. Interior modifications would reallocate spaces to accommodate the accessory indoor amusement use and eliminate meeting rooms, banquet spaces and other gathering places. An existing overhang area, in the northeast corner of the building, would be enclosed, and would not increase the building footprint. Moreover, the hotel would conform to the occupancy and fire code standards for the number of people in the hotel or gaming area. As such, the proposed accessory indoor amusement area would not cause an overcrowding or undue concentration of population.

K. *Whether the plot area is sufficient, appropriate and adequate for the use and the reasonably anticipated operation and expansion thereof.*

The proposed accessory use to the hotel, which has been in operation for over 30 years, would be within the interior of the hotel and complimentary and harmonious thereto. Moreover, the subject property is located within the OI zoning district, which permits commercial and

industrial uses, and is surrounded primarily by such similarly permitted uses. Finally, as previously discussed, and as also discussed in the TIS in Appendix B of this Expanded EA, the applicant has revised its plan to provide valet parking on-site to accommodate peak period parking demands.

L. *The physical characteristics and topography of the land.*

The subject property is developed with the existing hotel and associated parking areas, as well as landscaping. One minor exterior modification is proposed in the northeast corner of the property for a sally port, which would not increase the building footprint, and therefore, have no noticeable effect the physical characteristics or topography of the land.

M. *Whether the use to be operated is unreasonably near to a church, school, theater, recreational area or other place of public assembly.*

The nearest places of public assembly, in relation to the subject property, are as follows:

0.25±-mile – Nichols Road Park (southeast)
0.50±-mile – Andrew T. Morrow Elementary School (southwest)
0.50±-mile – Hamlet Windwatch Golf & Country Club (northwest)
1.24±-miles – Calvary Lutheran Church (northwest)

Given that the proposed accessory indoor amusement use would be in conjunction with an existing hotel that has been operating as such since circa mid-1980s, it is not anticipated that there would be any significant adverse impacts to such resources.

Consistency with the Comprehensive Plan Update and other Relevant Plans

The *Village of Islandia Comprehensive Plan Update,* August 2003, prepared by Phillips Preiss Shapiro Associates Inc. (hereinafter "Update"), indicates that the purpose of the *Update* is primarily focused on land use policies for remaining undeveloped properties within the Village, given that the Village was nearly built-out at the time the first *Comprehensive Plan* was adopted in 1995.

As the proposed special permit for an accessory video lottery gaming facility at the hotel, to allow for the accessory indoor amusement area consisting of 1,000 VLTs and two Suffolk OTB quick-bet kiosks, is within the existing Islandia Marriott Long

Island Hotel, none of the goals set forth in the *Update* are applicable. However, the proposed accessory use would utilize an existing developed property with a complimentary and harmonious use to one which currently exists. Moreover, as with the existing hotel, the proposed accessory use is permitted, by special permit from the Village Board of Trustees, within the OI zoning district. As such, the proposed action would not result in significant adverse impacts to land use, zoning or community character.

3.2 Transportation and Parking

A Traffic Impact Study (TIS) was performed by VHB to review the existing roadway and traffic conditions in the area, estimate the volume and pattern of traffic generated by the proposed project and analyze changes in the levels of service at the key intersection. An analysis of the existing and projected parking demand for the entire subject parcel was also conducted and summarized herein. Supplemental traffic data are included in Appendix B of this Expanded EA.

It should be noted that the original TIS, prepared in June 2016, analyzed the traffic associated not only with the project site, but also the traffic formerly to be redistributed to an off-site satellite parking lot that would be used during peak parking demand periods – primarily on Friday and Saturday evenings. The satellite parking has since been removed from the scope of the project due to a proposed on-site valet parking plan prepared by the applicant's architect.

The removal of the satellite parking lot from the project substantially reduces the amount of traffic generated by the project, simply because patrons would no longer be directed to a satellite parking lot when on-site parking is at capacity. As a result, there is substantially less traffic exiting the site during the peak hours studied. There is also no longer the need for shuttle buses to take patrons to and from the satellite parking lot. All of which substantially reduce the amount of traffic generated by this site. Since the results of the prior analysis indicated that all intersections would operate at acceptable levels of service and that there would be no mitigation required, the original analyses were not updated.

Study Methodology

The following describes the methodology used in this traffic study.

- The project site plan and related documents were reviewed to obtain an understanding of the project scope and layout.
- A review was made of the adjacent roadway system and the key intersections that might be significantly impacted by the proposed project were identified.
- Field inventories were made to observe the number and direction of travel lanes at the key intersections, along with signal timing, phasing and cycle lengths.

- Accident data for the most recent three-year period for the study area were reviewed, tabulated and summarized.
- The accident rates for the study intersections and roadway segments were calculated and compared to average New York State accident rates to qualitatively assess the relative safety of the intersections and roadway segments within the study area.
- Turning movement counts were collected at the key intersections using Miovision cameras during Friday and Saturday evening peak periods.
- The existing traffic volumes at the key intersections were expanded to the future No-Build year (2017).
- Any other significant planned developments in the vicinity of the project were identified and the traffic associated with those developments was included in No-Build analysis.
- The traffic generated by the proposed project was projected based on the nature of the proposed use.
- The site-generated volumes were distributed along the adjacent roadway network and were added to the No-Build volumes to produce the proposed Build volumes.
- Capacity analyses were performed for the key intersections and the primary site driveway for the Existing, No-Build and future Build conditions.
- The results of the analyses for the Existing, No-Build, and Build conditions were compared to assess any significant traffic impacts due to the proposed project.
- The primary site access point was evaluated.
- The adequacy of the proposed off-street parking was evaluated and the site layout was reviewed.
  The need for traffic mitigation measures was evaluated.

Existing Conditions

Evaluation of the transportation impacts associated with the proposed project requires a thorough understanding of the current transportation system in the project study area. Existing transportation conditions include roadway geometry, traffic control devices, peak hour traffic volumes, roadway operating characteristics, and parking availability. An inventory of available information on local roadways and traffic control in the vicinity of the project site was compiled. The following sections present a summary of this information.

Roadway and Intersection Conditions

The principal roadways and intersection in the project area are described below. The descriptions of the roadways and key intersections include the geometric conditions and traffic control characteristics.

Veterans Highway (NY 454)

Veterans Highway (NY 454) is an east-west arterial roadway that falls under the jurisdiction of New York State Department of Transportation (NYSDOT). Beginning at NY 25 in Commack, NY 454 runs in a southeasterly direction to its terminus at Sunrise Highway (NY 27) in Patchogue. Within the study area, NY 454 runs in a northwest-southeast direction west of the project site and provides two travel lanes in each direction, with additional through and turn-lanes lanes at major intersections. The posted speed limit on NY 454 within the study area is 55 miles per hour (mph). According to 2014 traffic volume counts and forecasts obtained from the NYS Traffic Data Viewer the combined two-way Average Annual Daily Traffic (AADT) on the segment of NY 454 within the study area varies between 31,500 and 33,000 vehicles per day (VPD).

Old Nichols Road

Old Nichols Road is a north-south collector-distributor roadway that falls under the jurisdiction of the Village of Islandia in the study area. Beginning at Moriches Road, it is initially designated as Nichols Road as it runs in the southwest direction to Terry Road, south of which it is designated as Old Nichols Road to NY 454. Within the study area, Old Nichols Road runs to the east of the project site and provides one travel lane in each direction. The posted speed limit in the study area is 30 mph. According to 2014 forecasts obtained from the NYS Traffic Data Viewer the combined two-way AADT on the segment of Old Nichols Road within the study area varies between 13,200 and 20,500 VPD.

Motor Parkway (CR 67)

Motor Parkway (CR 67) is an east-west collector-distributor roadway that falls under the jurisdiction of Suffolk County Department of Public Works (SCDPW). CR 67 runs north and east from Half-Hollow Road in Dix Hills to its terminus at Rosevale Avenue (CR 93) in Ronkonkoma and is designated as Motor Parkway east of Moreland Road. Within the study area, Motor Parkway runs to the north of the project site and provides two travel lanes in each direction between NY 454 and Bedford Avenue and then one lane in each direction east to Old Nichols Road, with additional turn-lanes at intersections. The posted speed limit on CR 67 in the study area is 45 mph. According to 2014 Traffic Volume Counts obtained from the NYSDOT the combined two-way AADT on the segment of Motor Parkway within the study area is approximately 10,850 VPD.

Express Drive North

Express Drive North or LIE North Service Road (LIE NSR) between Old Nichols Road and NY 454 runs westbound only along the south side of the project site. The posted speed limit on the section of the LIE NSR under study is 40 mph and it provides two travel lanes with additional turn-lanes at intersections. According to 2014 Traffic Volume Counts obtained from the NYSDOT the one-way AADT on the segment of Express Drive North within the study area is approximately 18,825 VPD.

Express Drive South

Express Drive South or LIE South Service Road (LIE SSR) between NY 454 and Old Nichols Road runs eastbound only to the south of the project site and LIE. The posted speed limit on the section of the LIE SSR under study is 40 mph and it provides two travel lanes. According to 2014 Traffic Volume Counts obtained from the NYSDOT the one-way AADT on the segment of Express Drive South within the study area is approximately 18,300 VPD.

Bedford Avenue

Bedford Avenue is a short Village of Islandia roadway that runs south from Motor Parkway along the west end of the site and terminates at Express Drive North. It provides one travel lane in each direction.

Study Area Intersections

To determine the potential traffic impacts of the proposed project, the following study intersections were identified for analysis under the Existing, No-Build and future Build conditions:

- Motor Parkway (CR 67) and Bedford Avenue (Signalized)
- Motor Parkway (CR 67) and Old Nichols Road (Signalized)
- Old Nichols Road and Express Drive North (Signalized)
- Old Nichols Road and Express Drive South (Signalized)
- Motor Parkway (CR 67) and NY 454 (Signalized)
- NY 454 and Express Drive North (Signalized)
- NY 454 and Express Drive South (Signalized)
- NY 454 and Old Nichols Road / Suffolk Avenue (Signalized)

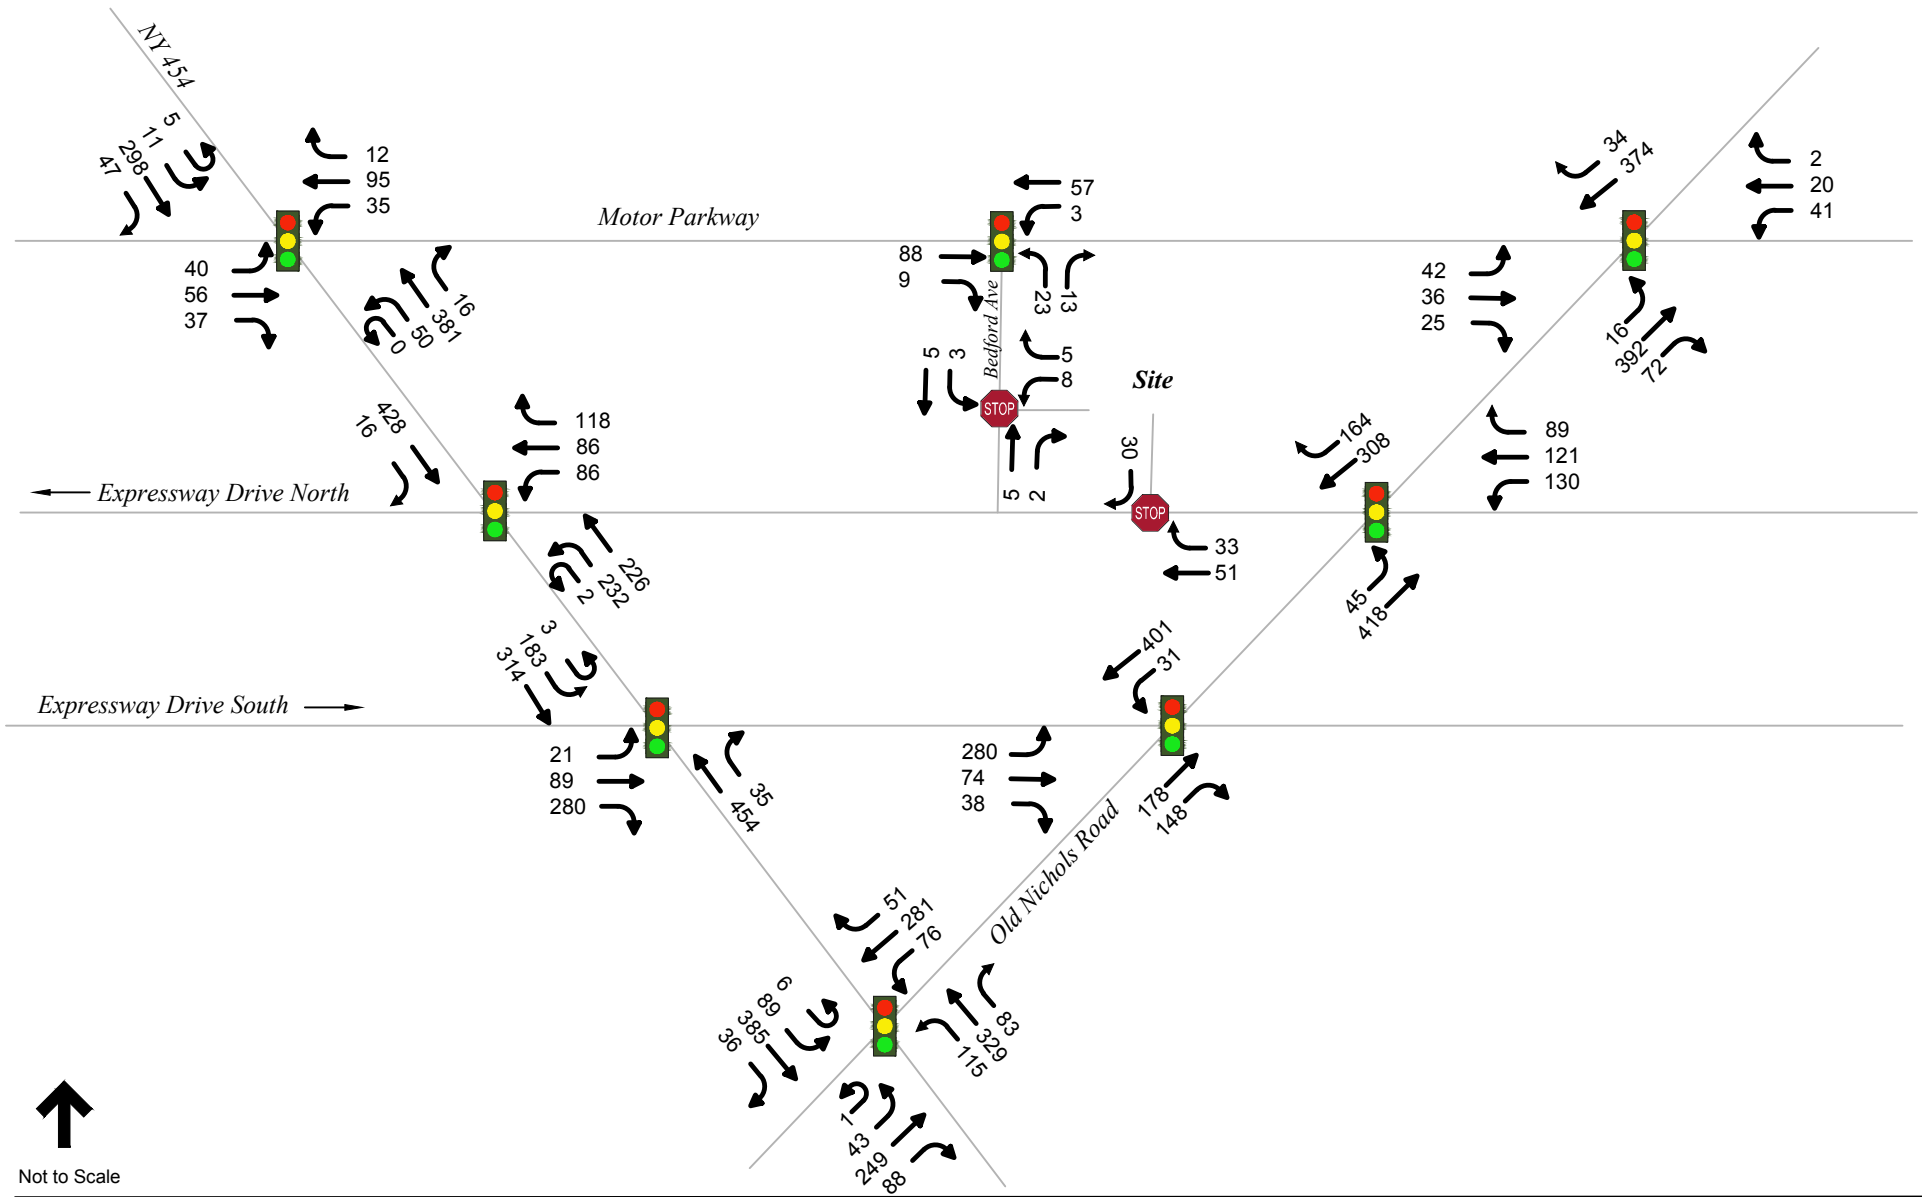

3.2.1 Existing Traffic Volume Data

At the eight study intersections, turning movement counts were collected using Miovision cameras on Friday, May 6, 2016 from 8:00 p.m. to 10:00 p.m. and again on Saturday, May 7, 2016 from 8:00 p.m. to 10:00 p.m. These times reflect the heaviest

traffic flows for the activity at the site under the proposal. The existing Friday p.m. and Saturday p.m. volumes are shown in Figure 5 and Figure 6, respectively. The turning movement counts can be found in Appendix A of the TIS in Appendix B of this Expanded EA.

In addition to the above, driveway counts at the existing at the hotel site were collected using Miovision cameras on Friday, May 13, 2016 from 8:00 p.m. to 10:00 p.m. and again on Saturday, May 14, 2016 from 8:00 p.m. to 10:00 p.m. Ideally these counts would have been conducted to coincide with the other turning movement counts described above. However, the study evaluation of the site driveway was later added to the scope of the study and the counts were conducted the following week. Based on information obtained from the hotel, there were no significant events that were held during either of the study periods.

Considering the nature of the development, the traffic volumes, peak hour factors and heavy vehicle percentages for the peak hour 8:00 p.m. to 9:00 p.m. were used in the analysis.

3.2.2 Future Conditions

The analysis of future conditions, with and without the proposed project ("Build" and "No-Build" conditions, respectively), was performed to evaluate the effect of the proposed project on future traffic conditions in the area. Background traffic volumes in the study area were projected to the year 2017, reflecting the year when the project is expected to be completed and operational. The No-Build Condition represents the future traffic conditions that can be expected to occur, even if the proposed project is not constructed. The No-Build Condition serves as a comparison to the Build Condition, which represents expected future traffic conditions resulting from both project and non-project generated traffic.

No-Build Condition

No-Build traffic volumes include all existing traffic and any new traffic due to background traffic growth and any other significant planned developments in the immediate vicinity of the project site.

Background Traffic Growth

To account for increases in general population and background growth not related to the proposed project or the other identified planned developments (discussed above), an annual growth factor was applied to the existing traffic volumes. Based on the NYSDOT, the growth rate anticipated for the Town of Islip, including the Village of Islandia, is 1.2% percent per year. Therefore, the 2016 existing traffic volumes were inflated using the growth factor of 1.2% to the year 2017, when the current project is estimated to be in operation. The resulting inflated volumes were then added to the traffic generated by the identified other planned development, as discussed in the following section.

Other Planned Development

The Village of Islandia identified the following planned development for inclusion in the analysis. This project is within in the study area and could have a measurable impact on traffic operations at the study intersections:

- The Preserve at Islandia – Located on the east side Old Nichols Road northeast of NY 454, this residential development would consist of 47 senior housing units and 25 condominiums. Based on the Traffic Impact Study prepared by Nelson and Pope, dated March 2008, it is estimated that this development would

generate 32 trips (Entering 9, Exiting 23) during the a.m. peak hour, 47 trips (Entering 30, Exiting 17) during the p.m. peak hour and 63 trips (Entering 33, Exiting 30) during the Saturday midday peak hour.

The estimated peak hour traffic of the other development occurs during the peak periods of adjacent street traffic. The p.m. peak hour falls normally between 4:00 p.m. and 6:00 p.m. and the Saturday peak hour falls normally between 11:00 a.m. and 2:00 p.m. As the peak hour of the generator that is the focus of this study is between 8:00 p.m. and 10:00 p.m., the estimated trips generated by the other planned development, were adjusted to reflect what is off-peak for a residential development. To present a conservative estimate of potential traffic from The Preserve at Islandia during this later time-of-day, 50 percent of the peak hour traffic projected for that development, in this TIS, was utilized.

The other planned development traffic for the Friday p.m. peak and Saturday p.m. peak as noted above was then assigned to the roadway network and is depicted in Figure 5 of the TIS in Appendix B of this Expanded EA. To obtain the 2017 No-Build traffic volumes at the study intersections, the trips anticipated to be generated by the other planned development in the area were then added to the traffic inflated for background growth to 2017 level, as discussed in the previous section.

Future Build Conditions

Typically, in the performance of studies for evaluating potential traffic impacts for land uses such as hotels, peak period trip generation data from published sources, such as the Institute of Transportation Engineer's *Trip Generation* would be utilized. However, peak period vehicle trip generation information for uses such as the one proposed at the Marriott are not available in *Trip Generation*. For the purposes of this study, peak period trip generation projections were developed using data contained in a study performed previously to evaluate an expansion of the VLT gaming operation at Resorts World Casino located at Aqueduct Raceway in Queens, New York. That study included vehicle and person-trip data collected at an existing VLT operation at Empire City Casino at Yonkers Raceway.

The Aqueduct VLT study considered the installation of 4,500 VLTs at that location, while the Islandia Marriott location is considering only 1,000 machines. In addition, both the Yonkers and Queens locations in the study, are located in urban areas with a great deal of available public transportation. However, the Aqueduct study contains information on person trips which can and was used to develop vehicle trip projections for the Islandia site. The person trips during peak periods projected for Aqueduct were reduced to account for the smaller number of VLTs proposed at the Islandia site and then an assumed vehicle occupancy utilized to generate projected vehicle trips for the Islandia site.

It should be noted that while the Islandia location would include hotel rooms, a restaurant and bar area, as well as two quick-bet kiosks, for the purpose of projecting trip generation, these areas were included in the trip generation projections for the number of VLTs proposed. Based on information from DNC, these other uses within the building would serve a support role to the VLT operation and would not draw visitors to the site that would not already be there to participate in the gaming operations. In addition, both the Yonkers and Aqueduct casinos include other entertainment opportunities within the buildings that would not be present in Islandia, such as nightclubs and shows/concerts. Based on this, the peak trip generation projections developed from the Aqueduct study are high-side conservative when applied to the Islandia site, which does not have these other uses that would draw patrons beyond the VLT operation. The peak period traffic levels used in this study are higher than what is likely to materialize at the Islandia site.

The Aqueduct Study indicates that arrival and departure activity at VLT operations peak on Friday and Saturday evenings between the hours of 8:00 p.m. and 10:00 p.m. The peak hour site-generated traffic for the proposed project was calculated and combined with the adjacent street traffic for 8:00 p.m. to 9:00 p.m. for analysis. The Aqueduct Study can be found in Appendix C of the TIS, which is included in Appendix B of this Expanded EA. It should be noted that the peak periods of operation for the site would be in the evening, after the peak traffic levels on the roadways in the area have subsided.

In the determination of the peak hour vehicle trip projections in Table 2 below, the person trip projections for the peak periods in the Aqueduct Study were reduced to account for the smaller number of VLTs (22% of Aqueduct's 4,500 machines) and then divided by a projected vehicle occupancy of 1.75 persons per vehicle. The vehicle occupancy assumption is also conservative as generally vehicle occupancy at entertainment uses is over 2.0.

Based on the above, the projected trip generation is shown below in Table 2, and is discussed further in the TIS in Appendix B of this Expanded EA:

Table 2 - Projected Trip Generation

	Friday PM Peak Hour		Saturday PM Peak Hour	
Component	Entering	Exiting	Entering	Exiting
Person Trips from Aqueduct Study	3459	1959	3858	3157
Adjust Person Trips to 22.2% of Aqueduct Study	768	431	856	701
Vehicle Occupancy Conversion Factor Applied	1.75	1.75	1.75	1.75
Resulting Vehicle Trip Generation Projections for Islandia	439	247	490	401
	686		891	

Satellite Parking Operations

As previously indicated, the use of an off-site, or satellite, parking area is no longer proposed. The applicant instead proposes to implement an on-site valet parking system to accommodate the peak parking demands that would occur on Friday and Saturday evenings. Therefore, vehicles will no longer be leaving the site to go to the satellite parking area and shuttle buses will not be transporting patrons to and from the site. Since the use of a satellite parking area resulted in higher traffic generations estimates, particularly the number of vehicles exiting the site, the trip projections used in the June 2016 study will continue to be used, providing a very conservative analysis. The trips are summarized in Tables 3 and 4 below.

Table 3 - Primary, Satellite & Shuttle Trips - Friday

Friday PM Peak Hour					
Primary Trips		Satellite Trips		Shuttle Trips	
Entering	Exiting (80% of total exiting Trips)	Rerouted from Hotel to Satellite Site	Exiting (20% of total exiting Trips)	From Hotel to Satellite Parking Site	From Satellite Parking Site to Hotel
439	198	241	49	6	6
637		290		12	

Table 4 - Primary, Satellite & Shuttle Trips - Saturday

Saturday PM Peak Hour					
Primary Trips		Satellite Trips		Shuttle Trips	
Entering	Exiting (80% of total exiting Trips)	Rerouted from Hotel to Satellite Site	Exiting (20% of total exiting Trips)	From Hotel to Satellite Parking Site	From Satellite Parking Site to Hotel
490	321	169	80	6	6
811		249		12	

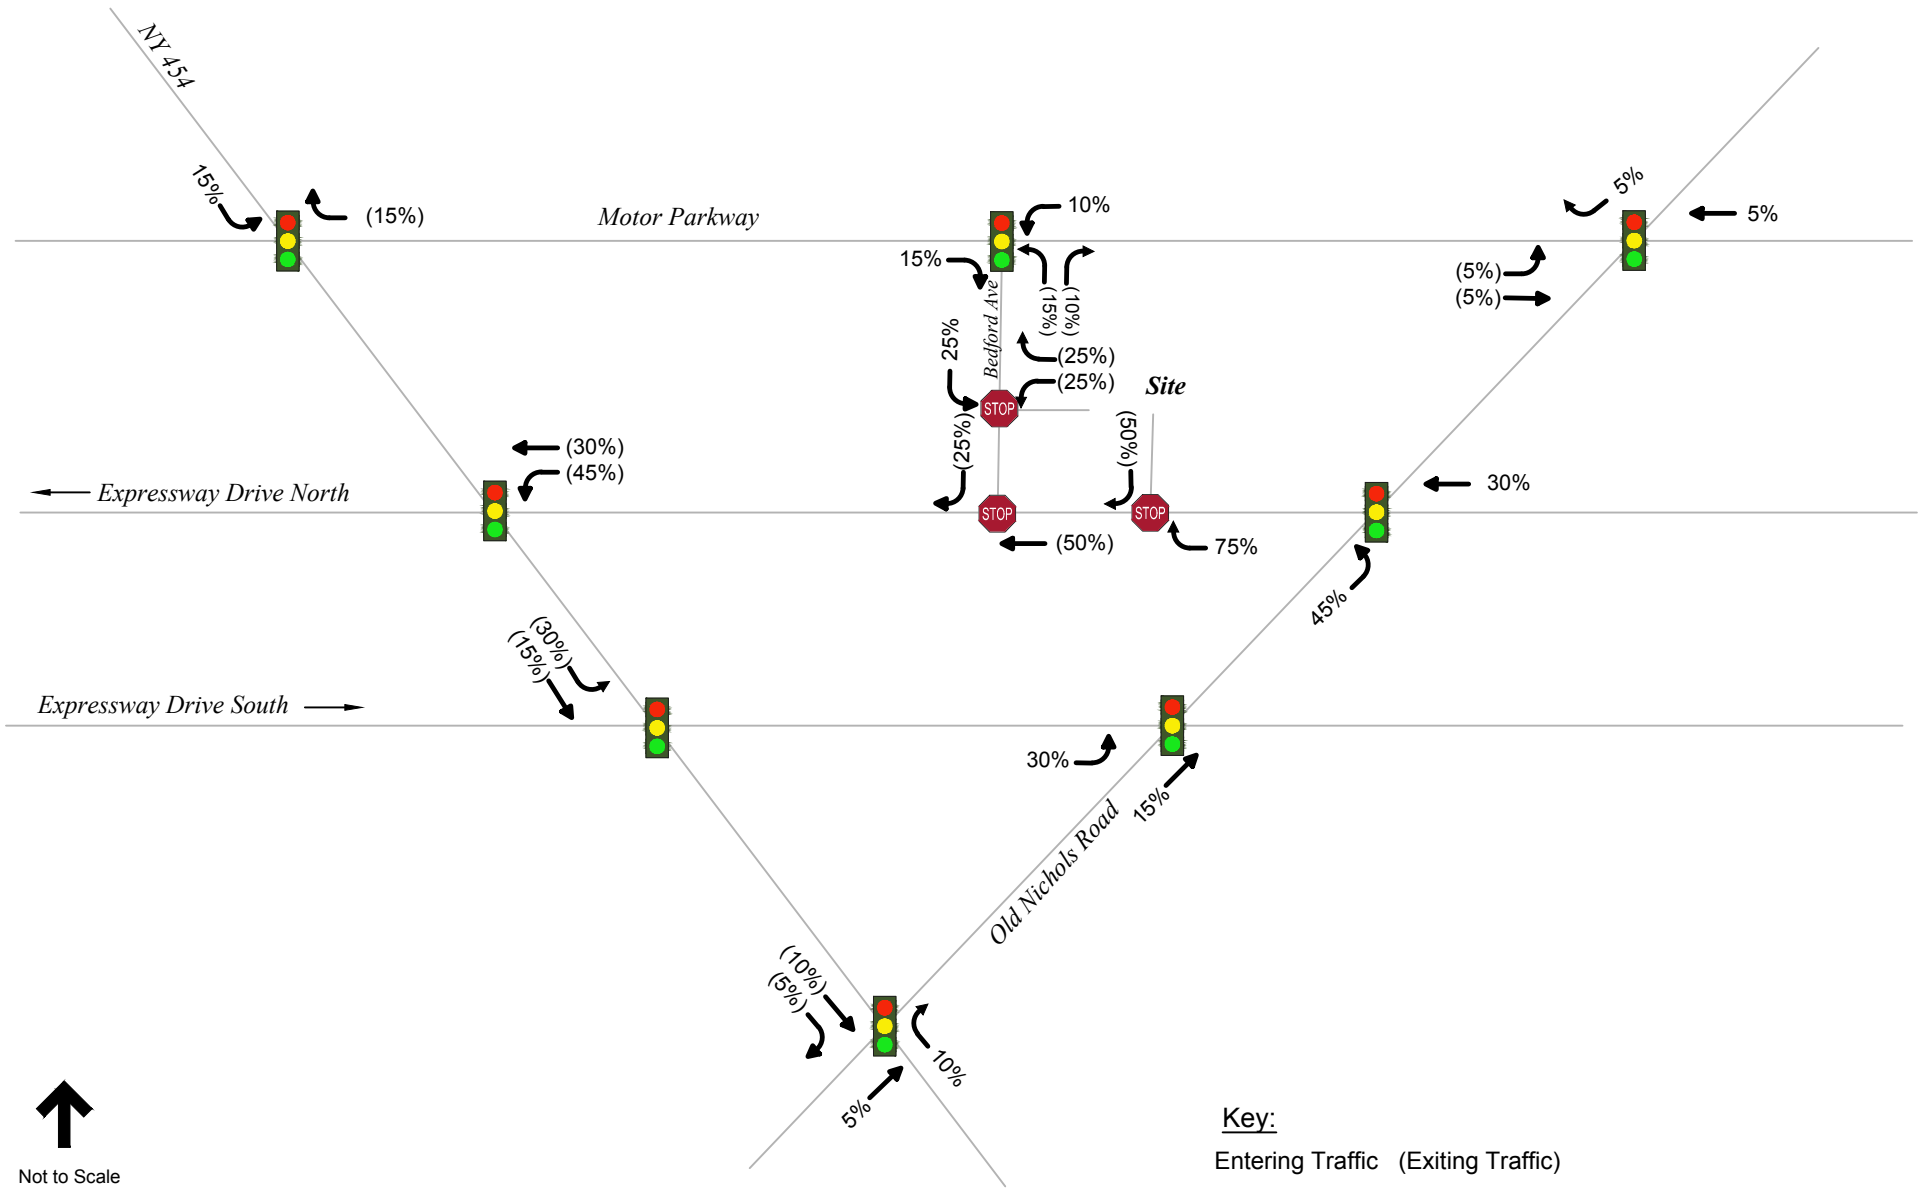

Trip Distribution and Assignment

The trips originating from and destined to the site were assigned to the adjacent roadways based on characteristics of the roadway network, the location of the proposed site access points, existing travel patterns, and likely destination points. The trip distribution percentages for the primary trips are shown in Figure 7. These were then applied to the traffic volumes shown in Tables 3 and 4 for the Friday p.m. and Saturday p.m. peak hours with the resulting trip assignment presented in Figure 8.

The trip distribution percentages for the satellite parking trips and the shuttle trips are shown in Figure 9. These were then applied to the traffic volumes shown in Tables 3 and 4 for the Friday p.m. and Saturday p.m. peak hours with the resulting trip assignment presented in Figure 10.

To determine the future Build Condition traffic volumes, the project-generated trips were added to the No-Build traffic volumes at the key intersections. The resulting Build traffic volumes for the Friday p.m. and Saturday p.m. peak hours are shown in Figures 11 and 12, respectively.

As noted earlier in the Introduction, the satellite parking area has been eliminated from the project. Therefore, the traffic that was directed from the project site to the satellite parking site would be eliminated. As a result, the Build Condition traffic volumes at certain intersections, primarily to the west of the project site are overstated and would be much lower than is presented in this analysis. Therefore, this analysis presents a very high-side conservative analysis.

3.2.3 Traffic Operations Analysis

Measuring existing traffic volumes and projecting future traffic volumes quantifies traffic flow within the study area. To assess the quality of traffic flow, roadway capacity analyses were conducted with respect to the Existing, No-Build and Build conditions. These capacity analyses provide an indication of the adequacy of the roadway facilities to serve the anticipated traffic demands.

Level of Service Analysis

LOS analyses were conducted for the Existing, No-Build and future Build conditions for the key signalized study intersections and for the unsignalized site access points. The peak hour traffic volumes during the hour between 8:00 p.m. and 9:00 p.m. were used as the base for all the study intersections.

Signalized Intersection Analysis Results

The results of the capacity analyses for the following signalized intersections in Existing, No-Build and future Build conditions are summarized in Tables 5 and 6 below, for Friday p.m. and Saturday p.m. periods, respectively.

- Motor Parkway (CR 67) and Bedford Avenue (Signalized)
- Motor Parkway (CR 67) and Old Nichols Road (Signalized)
- Old Nichols Road and Express Drive North (Signalized)
- Old Nichols Road and Express Drive South (Signalized)
- Motor Parkway (CR 67) and NY 454 (Signalized)
- NY 454 and Express Drive North (Signalized)
- NY 454 and Express Drive South (Signalized)
- NY 454 and Old Nichols Road / Suffolk Avenue (Signalized)

The detailed capacity analysis worksheets are contained in Appendix E of the TIS, which is in Appendix B of this Expanded EA.

Table 6 shows that during the Friday p.m. peak, all eight signalized study intersections operate well and consistent with the No-Build levels. There is no change in level-of-service at the study intersections from No-Build to Build condition, except at NY 454 and Express Drive South. The LOS at this intersection moved from B in the No-Build Condition, to a C in the Build condition, with the overall intersection delay increasing by only 2.4 seconds.

Analysis Results

Table 7 shows that during the Saturday p.m. peak hour, all eight signalized study intersections operate well and consistent with the No-Build levels. There is no change in level-of-service at the intersections from the No-Build to Build condition, except at Old Nichols Road and Express Drive North, NY 454 and Express Drive North and NY 454 and Express Drive South. The LOS at the intersection of Old Nichols Road and Express Drive North moved from B in the No-Build Condition to C in the Build condition, with the overall intersection delay increasing by only 2.5 seconds. The LOS at the intersection of NY 454 and Express Drive North moved from C in the No-Build Condition to D in the Build condition, with the overall intersection delay increasing by 6.7 seconds. The LOS at the intersection of NY 454 and Express Drive South moved from B in the No-Build Condition to C in the Build condition, with the overall intersection delay increasing by 3.8 seconds. Even with these minor changes, all intersections continue to operate in acceptable levels of service (LOS D or better).

It should be noted that due to the actuation of a traffic signal, in some instances, the green time (on a traffic signal) allocated to a certain movement or approach, may be increased based upon demand. Therefore, intersection delays may actually decrease

on that movement because more green time is allocated and would increase on another movement where less green time is allocated.

The overall intersection delay may also go down as a result of this operation. This is due to the fact that overall intersection delay is based on a weighted average of all the delays on each of the individual movements. If a higher volume movement experiences less delay, the overall intersection delay would actually decrease. Although not always the case, such is the case with the intersections of Motor Parkway at Old Nichols Road and NY 454 at Old Nichols Road/ Suffolk Avenue.

Site Access

The hotel site is served by three access driveways which all allow for both entering and exiting traffic movements. The primary access point is located on Express Drive North and allows for right-turns into and out of the site, given the one-way nature of the adjacent roadway. A second access point is located on Bedford Avenue, adjacent to the west side of the site and provides full movements into and out of the site. A third, minor access is located north of the site to Kosciusko Street, a dead end village roadway, and provides right-turns into and left-turns out of the site. Kosciusko Street intersects Bedford Avenue off the northwest corner of the site. For the purpose of conservative analysis, the access driveways located on Express Drive North and Bedford Avenue were analyzed.

The results of the unsignalized capacity analysis of the two site access driveways are summarized in Tables 7 and 8 below for Friday p.m. and Saturday p.m. periods, respectively. The detailed capacity analysis worksheets are contained in Appendix E of the TIS, which is in Appendix B of this Expanded EA.

Table 7 - Level of Service Summary - Site Accesses - Friday PM

Intersection	Approach	Existing 2016		No-Build 2017		Build 2017	
		Delay	LOS	Delay	LOS	Delay	LOS
Bedford Avenue & Hotel Site Access	WB	8.6	A	8.6	A	13.1	B
	SB L	7.2	A	7.2	A	7.5	A
Express Drive North & Hotel Site Access	SB	8.8	A	8.8	A	16.0	C

Table 8 - Level of Service Summary - Site Accesses - Saturday PM

Intersection	Approach	Existing 2016		No-Build 2017		Build 2017	
		Delay	LOS	Delay	LOS	Delay	LOS
Bedford Avenue & Hotel Site Access	WB	8.5	A	8.5	A	12.4	B
	SB L	7.2	A	7.2	A	7.5	A
Express Drive North & Hotel Site Access	SB	8.8	A	8.9	A	18.2	C

Tables 7 and 8 indicate that the hotel access driveways operate well in the Build condition, with moderate delays to existing traffic. It is noted that the operation of the driveways does not impart any delays to through vehicles on Express Drive North, as exiting vehicles must yield to traffic on the major roadway.

3.2.4 Parking and Circulation

Off-street parking required is outlined on the Parking Schedule set forth in the Village of Islandia Zoning Code Chapter 177, Attachment 7, which stipulates requirements for hotels, restaurants and bars.

Table 9 - Table of Off-Street Parking Requirements

Use	Requirements Per Zoning Code	Unit	Required Off-Street Parking Spaces	
Restaurant	1 Space per 2 Seats Provided	105 Seats	1 Space Per 2 Seats x 105 Seats =	53 Spaces
	or			
	2 Spaces per 200 GSF Provided, Whichever is Greater	3,206 GSF	2 Spaces per 200 GSF x 3,206 GSF =	33 Spaces
Bar	1 Space per 2 Seats Provided	50 Seats	1 Space Per 2 Seats x 50 Seats =	25 Spaces
	or			
	2 Spaces per 200 GSF Provided, Whichever is Greater, Plus	383 GSF	2 Spaces per 200 GSF x 3,206 GSF =	33 Spaces
	1 Space per 12 GSF of Bar Area	383 GSF	1 Space Per 12 GSF x 383 GSF =	32 Spaces
Hotel	1 Space Per Sleeping Room	245 Rooms	1 Space x 245 Rooms =	245 Spaces
	Plus			
	1 Space Per Each Employee	85 Employees	1 Space x 85 Employees =	85 Spaces
Total Required				473 Spaces

Based upon the parking requirements outlined in Table 9, the proposed project requires 473 off-street parking spaces. The existing hotel site provides 649 marked parking stalls, pursuant to the ALTA/ASCM Land Title Survey prepared by Sidney B. Bowne and Son, LLP, dated February 2, 2016. This count would be reduced by six spaces to 643, post-renovation, to accommodate the proposed sally port. While this level of parking exceeds Village Code by 170 spaces (643 – 473), the proposed operation of the site does not lend itself to direct application of the code in the determination of parking sufficiency. As such, a projection of actual parking demands based on the specifics of the sites proposed operation has been performed.

Estimated Parking Necessary for Post-Renovation Operations

Although the hotel site would continue to meet code requirements with regard to parking provided on-site, the specific nature of the accessory use would result in increased peak period parking demand. To estimate the anticipated actual peak parking demand at the site, the components of the sites operation were considered.

1000 VLTs – based on a vehicle occupancy of 1.75 persons per vehicle and a fully occupied gaming floor, this component could be expected to generate 571 parked vehicles.

245 Hotel Rooms – Under typical situations, an occupied hotel room would be expected to generate one parked vehicle. However, based on discussions with the applicant, it is anticipated that the majority of hotel guests would already be at the site for the gaming experience and would have been parked on-site regardless. Therefore, assuming that all hotel rooms are occupied and guests would have been parked at the site regardless of whether or not they had a hotel room, a conservative estimate of one parked vehicle for every two rooms is assumed here, for a total of 123 parked vehicles.

155 Restaurant / Bar Seats –Based on the Village Code, a restaurant would be expected to generate one space for every two seats provided. However, based on discussions with the applicant, it is anticipated that the restaurant would be patronized almost exclusively by guests that are there for the gaming experience. As a result, these guests would have already been parked on-site, and are accounted for in our VLT parking estimates. However, a conservative estimate of one parked vehicle for every six seats has been provided, for a total of 26 parked vehicles.

85 Total Staff – The applicant has indicated that a maximum of 85 staff members would be on-site at any given time. This staff will be allocated for all the uses within the hotel. Based on our experience working on other projects with uses such as hotels and restaurants, VHB has found that the use of carpooling, public transportation, and other non-motorized modes of transportation is very high. Therefore, a conservative estimate has been provided of two parked vehicles for every three staff members, for a total of 56 parked vehicles.

The inclusion of two quick-bet kiosks in the renovation plan is not anticipated to generate any significant level of additional parking demand as, based on information provided by the applicant, this ancillary component is not expected to attract patrons who are not already there.

Based on the above the total anticipated peak parking demand is expected to be 776 spaces, or roughly between 750 and 800 parked vehicles.

Parking Operations

As noted above, the peak parking demands at the site are expected to approach 800 parked vehicles. Given the provision of 643 marked parking spaces on the hotel site (post-construction), the demands are likely to approach or exceed supply during peak periods of operation, most notably on Friday and Saturday evenings. In order

to accommodate this parking demand, the project architect has developed a valet parking plan, which would allow the site to accommodate up to 827 parking spaces. The plan depicts that the west side of the site would be allocated for parking of valeted vehicles. Since a valet would be parking the vehicles, they can more efficiently utilize the area to maximize parking, and would increase the parking capacity of the site by 184 spaces. Valet parking would be available on peak days, such as on Fridays and Saturdays, or on other days as determined by management. The 56 employees (2/3 of the 85 employees) would be encouraged to use valet parking to allow for more spaces to be open to the public.

The valet would be located at both the front and rear entrances to the building. All pick-ups and drop-offs would occur at those points, similarly to the way patrons use these areas today. When the valet is in operation, the location of the valet drop-off spot would be designated by signage, so patrons entering the site are aware this service is offered, and can find the drop-off locations.

The valet parking area would accommodate 535 vehicles and the balance of the spaces (292 spaces) would be open to the public for parking. As noted above, using a valet parking system, the overall site can accommodate 827 parking spaces, which well exceeds the anticipated peak parking demand of 800 vehicles, which is a very conservative estimate. Since the parking projections are very conservative, there is no need for an off-site satellite parking area. Moreover, since the satellite parking area is no longer required, it also substantially reduces the amount of traffic the project would generate. There would also no longer the need for shuttle buses to transport patrons back and forth between the two lots. . In addition, without the use of a satellite parking area, the need to set aside dedicated parking on-site for overnight hotel guests is eliminated as all site visitors will be on the site itself and none diverted to on off-site location.

It is also important to note that the Applicant does not intend to offer any type of private transportation service to and from the site for its patrons. Therefore, parking spaces to accommodate their own buses, shuttle buses and vans are not required or anticipated. Outside buses, shuttle buses and vans that are contracted by patrons would be allowed to access the site for purposes of pick-ups and drop-offs, however, they would not be permitted to stage on site, except momentarily, while they wait for guests to load and unload.

3.2.5 Conclusions

Based on the results of the analyses summarized above, VHB's conclusions are:

- The proposed renovations to the hotel would result in increases in traffic generation that can be accommodated by the surrounding street network.

- The peak periods of traffic activity at the site would occur on Friday and Saturday evenings, when the heaviest traffic on the roadway network has subsided.
- All study intersections would operate well in the Build condition, with acceptable levels of service (LOS).
- Changes in the LOS at some intersections are reasonable and would be well within acceptable standards for intersection operation.
- The existing site access points would be adequate to provide for the anticipated traffic levels into and out of the site.
- An unsignalized capacity analysis for the hotel access driveway indicates that vehicles would enter and exit the site with moderate levels of delay.
- Since the level of parking provided at the hotel site may not be sufficient to accommodate parking demands during peak periods (primarily Friday and Saturday evenings), a valet parking system would be implemented to maximize the number of vehicles that can be accommodated on-site. With the use of the valet parking system, the peak parking demands can be accommodated on-site, and the off-site satellite parking arrangement would no longer required.

3.3 Public Need and Benefit

The proposed action is a special permit for an accessory video lottery gaming facility at the Islandia Marriott hotel, to allow the accessory use thereto, for an indoor amusement use. Such accessory use would not necessarily increase the intensity of use of the existing hotel, but would diversify the uses. Specifically, existing meeting rooms and banquet areas, as well as the swimming pool, would be replaced by 1,000 VLTs and two Suffolk OTB quick-bet kiosks.

The proposed action would benefit the surrounding community by providing approximately 150 full-time-equivalent (FTE) jobs, as well as an alternative indoor amusement venue (i.e., VLTs) that does not currently exist in Suffolk County. This would be accomplished by modifying interior spaces of an existing hotel, which has been established in the community for over 30 years, without requiring any upgrades or modifications to existing infrastructure, such as water supply connections or wastewater disposal.

The attraction of the only VLT facility in Suffolk County would draw people to this location as a destination that would have positive economic impacts on surrounding businesses in the area (e.g., shopping and restaurants), and not just the hotel itself.

It is often perceived that the introduction of gaming facilities causes an increase in crime, although analysis prepared by The National Gambling Impact Study Commission (NGISC), created by Congress in 1996 to assess the relationship between gambling and levels of crime, as well as The Public Sector Gaming Study Commission (PSGSC), formed in 1999 by the National Council of Legislators from

Gaming States (NCLGS) to provide public sector advice about gaming, indicates that there is no direct or quantifiable correlation between legalized or casino-style gambling and crime. Moreover, the NCLGS stated, "The security on the premises of gambling facilities, the multiple layers of regulatory control, and the economic and social benefits that gambling seems to offer to communities are effective deterrents of criminal activity."

It is likely, however, that the increased visitation to the hotel and the Village in general would likely increase Village Court activity, due to other violations and incidents that may occur within the Village, as well as the potential need for additional code enforcement activities. While it is not possible to quantify this increase, it would not likely be significant.

It is noted that guests of the hotel may want to use other Village recreational facilities and resources. Recent legislation authorized the Town of Islip to transfer ownership of the seven-acre Old Nichols Road Park to the Village. Renamed the Village of Islandia First Responders Memorial Recreational Field, the Village of Islandia indicated it is looking forward to the local business community providing its assistance in maintaining the pristine conditions of our ball fields.

As such, and in connection with the support of other Village of Islandia operations (e.g., code enforcement, beautification), as well as park improvements and maintenance, the applicant has committed to providing financial assistance to the Village of Islandia toward future park improvements, Village beautification, infrastructure and any other Village support services that it may deem appropriate, to maintain a level of service and quality of life the residents of the Village of Islandia currently enjoy.

It is further noted that on-street parking in the vicinity of the subject property is permitted on the east side of Bedford Avenue, and either side of Kosciusko Street. Should the Village wish to change such regulations after full implementation of the proposed accessory use to the hotel, such funding could support the purchase of signage advising motorists of such parking regulations and/or prohibitions.

Introduction

This revised study summarizes the comprehensive evaluation of the potential traffic impacts associated with the request for a Special Permit for the Marriot Hotel located in the Incorporated Village of Islandia. The purpose of this study is to determine if there are any significant traffic impacts due to the proposed project and to evaluate and propose mitigation measures, if required. This report summarizes the data collection process, traffic analysis procedures, and study conclusions and presents the findings of the traffic study.

It is should be noted that the original Traffic Impact and Parking Analysis Report prepared by VHB for the project dated June 2016 analyzed the traffic associated not only with the project site, but also analyzed the traffic redistributed to an off-site satellite parking lot that would be utilized during peak times, primarily on Friday and Saturday evenings. The satellite parking lot has since been removed from the scope of the project. The Applicant's architect, SOSH NY has demonstrated that a portion of the project site can be allocated for valet parking so all parking can be contained on site. The valet parking operation will be further described herein.

The removal of the satellite parking lot from the project significantly reduces the amount of traffic generated by the project. This is simply because patrons will no longer be directed to a satellite parking lot when the parking area at the primary site is at capacity. As a result there is significantly less traffic exiting the site during the peak hours studied. There is also no longer the need for shuttle buses to take patrons to and from the satellite parking lot. All of which significantly reduce the amount of traffic generated by this site. Since the results of the prior analysis indicated that all intersections would operate at acceptable levels of service and that there would be no mitigation required, our original analyses were not updated, as they would show only more favorable results if they were.

The original analyses and figures have been left in the report and the text in the relative sections has been updated accordingly to describe the changes to the application. Based on the results of the revised study, more completely described herein, it has been concluded that the proposed action will not have a significant impact on the study intersections or roadway network.

Project Description

Delaware North Companies Parks & Resorts, Inc. (DNC) has made application to the Incorporated Village for a Special Permit to be granted by the Village for the Islandia Marriott Long Island Hotel Property (hereinafter "Marriott" or "hotel") located at 3635 Express Drive North. Specifically, the Applicant is seeking a Special Permit to allow the operation of Video Lottery Terminals (VLTs) as an accessory use to the hotel operation.

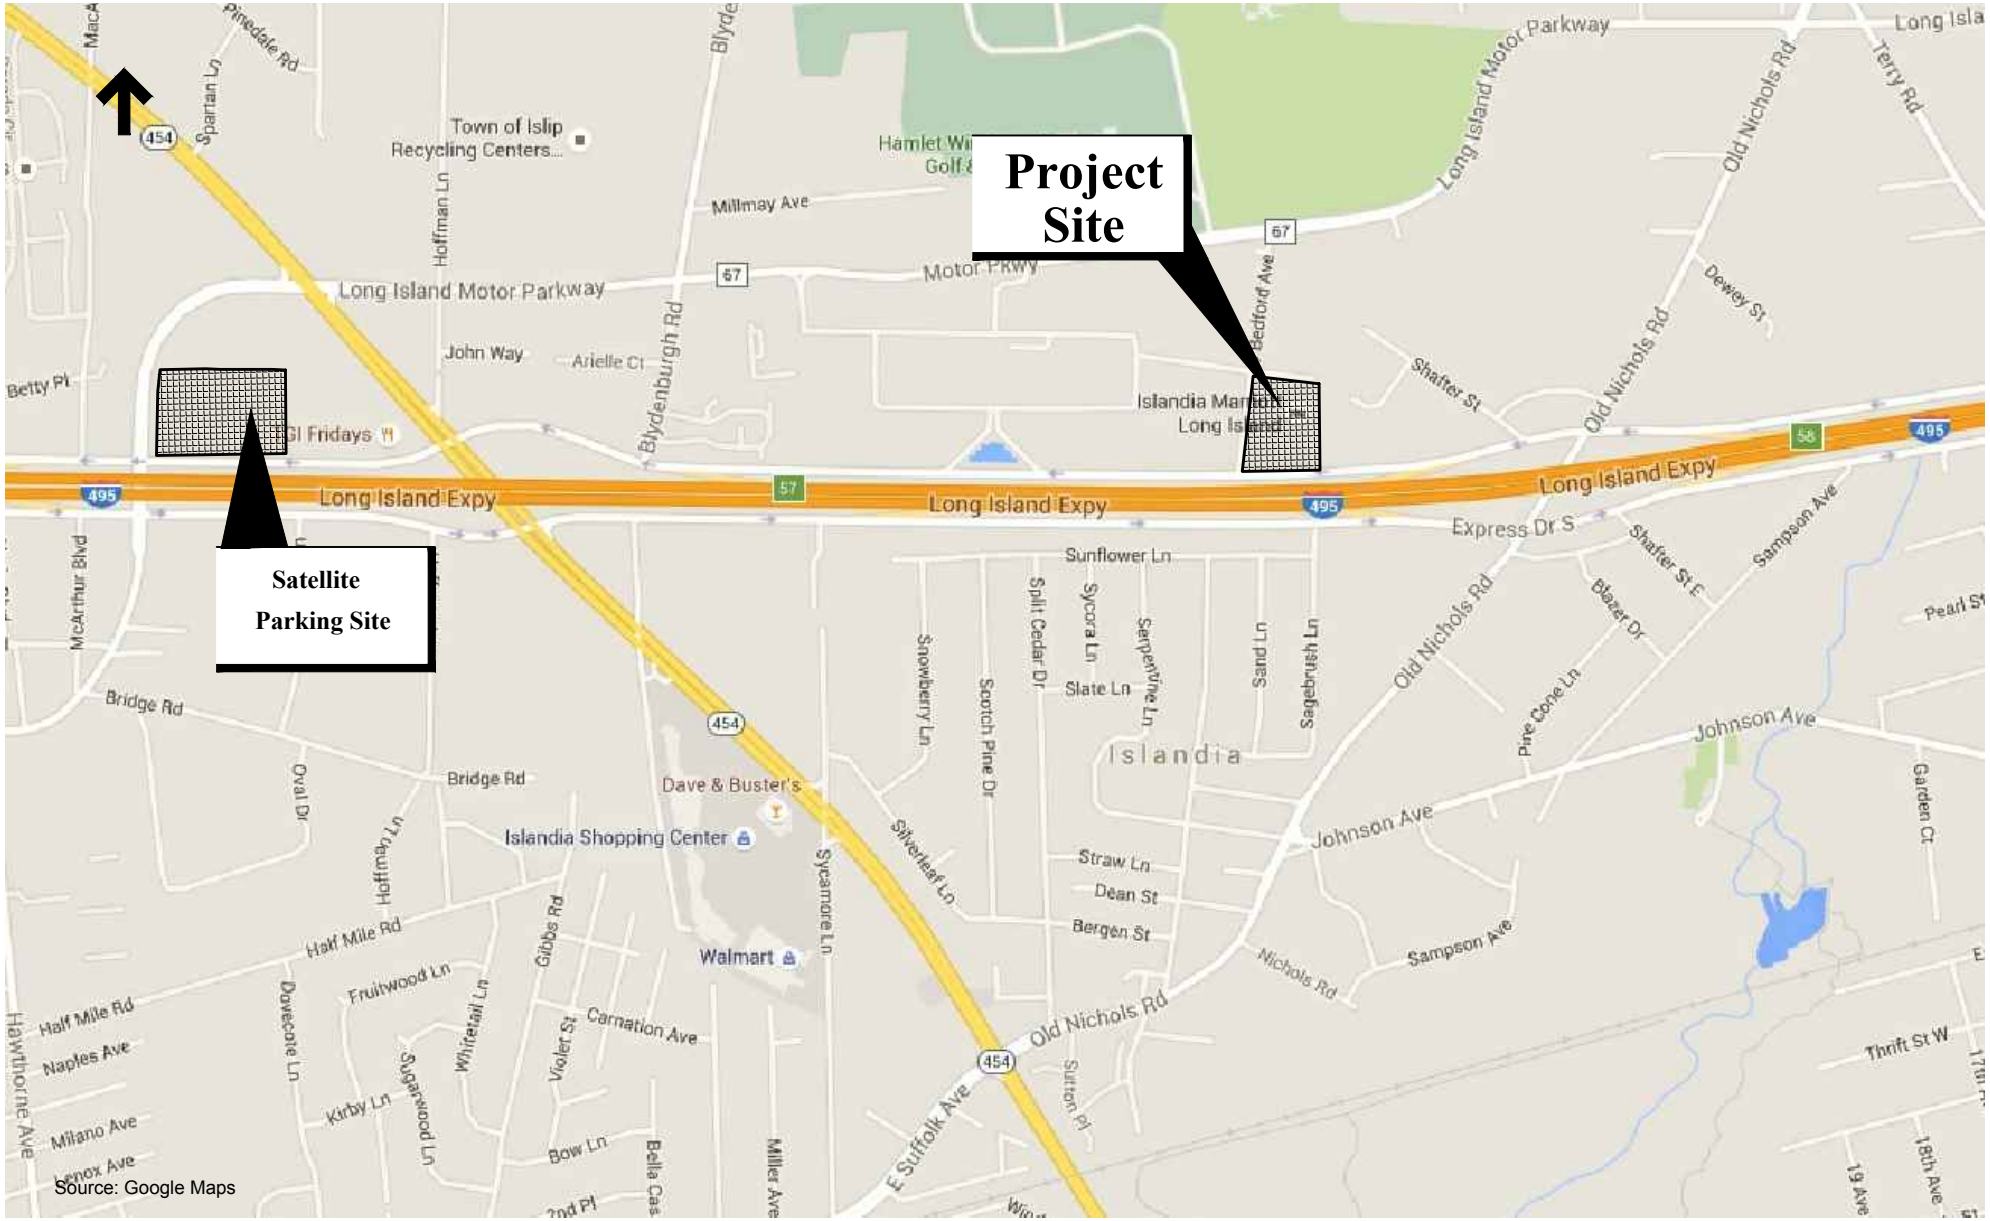

The original approved Site Plan for the hotel dated September 11, 1978 prepared by John Jacobson Associates, Architectural and Engineering Design obtained from Village records indicated that there were277 guest rooms, 10,370 square feet of meeting and banquet space, a restaurant with a total of 220 seats, a night club and other ancillary spaces in a building. It further noted the hotel site is 7.95 acres in size and contains 673 marked parking stalls.

Based upon information obtained from the Applicant, the site currently contains 278 guest rooms, 11,850 square feet of meeting and banquet space, a restaurant and bar with 155 seats, and a pool. The site also contains 649 parking spaces. As can be seen, the site and internal use of the building has been altered since the Site Plan was approved in 1987. The Applicant requested record documents from the Village to gain a better understanding how the site and building have been modified over the years, but no such documents were available.

The proposed modifications to the interior of the building include a reduction in guest rooms to 245, along with the construction of space to support a total of 1,000 VLTs and support space. Also included are two Off-Track Betting (OTB) quick-bet kiosks. The modifications also include the removal of the existing pool area. The restaurant and bar spaces, with a total of 155 seats, will remain. The number of parking stalls on-site will be reduced by six to 643.

The hotel site is served by three access driveways which all allow for both entering and exiting traffic movements. The primary access point is located on Express Drive North and allows for right-turns into and out of the site given the one-way nature of the adjacent roadway. A second access point is located on Bedford Avenue, adjacent to the west side of the site and provides full movements into and out of the site. A third, minor access is located north of the site to Kosciusko Street, a dead end village roadway, and provides right-turns into and left-turns out of the site. Kosciusko Street intersects Bedford Avenue off the northwest corner of the site.

Study Methodology

The following describes the methodology used in this traffic study:

- The project site plan and related documents were reviewed to obtain an understanding of the project scope and layout.
- A review was made of the adjacent roadway system and the key intersections that might be significantly impacted by the proposed project were identified.
- Field inventories were made to observe the number and direction of travel lanes at the key intersections, along with signal timing, phasing and cycle lengths.
- Accident data for the most recent three-year period for the study area were reviewed, tabulated and summarized.
- The accident rates for the study intersections and roadway segments were calculated and compared to average New York State accident rates to qualitatively assess the relative safety of the intersections and roadway segments within the study area.
- Turning movement counts were collected at the key intersections using Miovision cameras during Friday and Saturday evening peak periods.
- The existing traffic volumes at the key intersections were expanded to the future No-Build year (2017).
- Any other significant planned developments in the vicinity of the project were identified and the traffic associated with those developments was included in No-Build analysis.
- The traffic generated by the proposed project was projected based on the nature of the proposed use.
- The site-generated volumes were distributed along the adjacent roadway network and were added to the No-Build volumes to produce the proposed Build volumes.
- Capacity analyses were performed for the key intersections and the primary site driveway for the Existing, No-Build and future Build conditions.
- The results of the analyses for the Existing, No-Build, and Build conditions were compared to assess any significant traffic impacts due to the proposed project.
- The primary site access point was evaluated.
- The adequacy of the proposed off-street parking was evaluated and the site layout was reviewed.
- The need for traffic mitigation measures was evaluated.

2

Existing Conditions

Evaluation of the transportation impacts associated with the proposed project requires a thorough understanding of the current transportation system in the project study area. Existing transportation conditions include roadway geometry, traffic control devices, peak hour traffic volumes, roadway operating characteristics, and parking availability. An inventory of available information on local roadways and traffic control in the vicinity of the project site was compiled. The following sections present a summary of this information.

Roadway and Intersection Conditions

The principal roadways and intersections in the project area are described below. The descriptions of the roadways and key intersections include the geometric conditions and traffic control characteristics.

Veterans Highway (NY 454)

Veterans Highway (NY 454) is an east-west arterial roadway that falls under the jurisdiction of New York State Department of Transportation (NYSDOT). Beginning at NY 25 in Commack, NY 454 runs in a southeasterly direction to its terminus at Sunrise Highway (NY 27) in Patchogue. Within the study area, NY 454 runs in a northwest-southeast direction west of the project site and provides two travel lanes in each direction, with additional through and turn-lanes lanes at major intersections. The posted speed limit on NY 454 within the study area is 55 miles per hour (mph). According to 2014 traffic volume counts and forecasts obtained from the NYS Traffic Data Viewer the combined two-way Average Annual Daily Traffic

(AADT) on the segment of NY 454 within the study area varies between 31,500 and 33,000 vehicles per day (VPD).

Old Nichols Road

Old Nichols Road is a north-south collector-distributor roadway that falls under the jurisdiction of the Village of Islandia in the study area. Beginning at Moriches Road, it is initially designated as Nichols Road as it runs in the southwest direction to Terry Road, south of which it is designated as Old Nichols Road to NY 454. Within the study area, Old Nichols Road runs to the east of the project site and provides one travel lane in each direction. The posted speed limit in the study area is 30 mph. According to 2014 forecasts obtained from the NYS Traffic Data Viewer the combined two-way AADT on the segment of Old Nichols Road within the study area varies between 13,200 and 20,500 VPD.

Motor Parkway (CR 67)

Motor Parkway (CR 67) is an east-west collector-distributor roadway that falls under the jurisdiction of Suffolk County Department of Public Works (SCDPW). CR 67 runs north and east from Half Hollow Road in Dix Hills to its terminus at Rosevale Avenue (CR 93) in Ronkonkoma and is designated as Motor Parkway east of Moreland Road. Within the study area, Motor Parkway runs to the north of the project site and provides two travel lanes in each direction between NY 454 and Bedford Avenue and then one lane in each direction east to Old Nichols Road, with additional turn-lanes at intersections. The posted speed limit on CR 67 in the study area is 45 mph. According to 2014 Traffic Volume Counts obtained from the NYSDOT the combined two-way AADT on the segment of Motor Parkway within the study area is approximately 10,850 VPD.

Express Drive North

Express Drive North or LIE North Service Road (LIE NSR) between Old Nichols Road and NY 454 runs westbound only along the south side of the project site. The posted speed limit on the section of the LIE NSR under study is 40 mph and it provides two travel lanes with additional turn-lanes at intersections. According to 2014 Traffic Volume Counts obtained from the NYSDOT the one-way AADT on the segment of Express Drive North within the study area is approximately 18,825 VPD.

Express Drive South

Express Drive South or LIE South Service Road (LIE SSR) between NY 454 and Old Nichols Road runs eastbound only to the south of the project site and LIE. The posted speed limit on the section of the LIE SSR under study is 40 mph and it provides two travel lanes. According to 2014 Traffic Volume Counts obtained from the NYSDOT the one-way AADT on the segment of Express Drive South within the study area is approximately 18,300 VPD.

Bedford Avenue

Bedford Avenue is a short Village of Islandia roadway that runs south from Motor Parkway along the west end of the site and terminates at Express Drive North. It provides one travel lane in each direction.

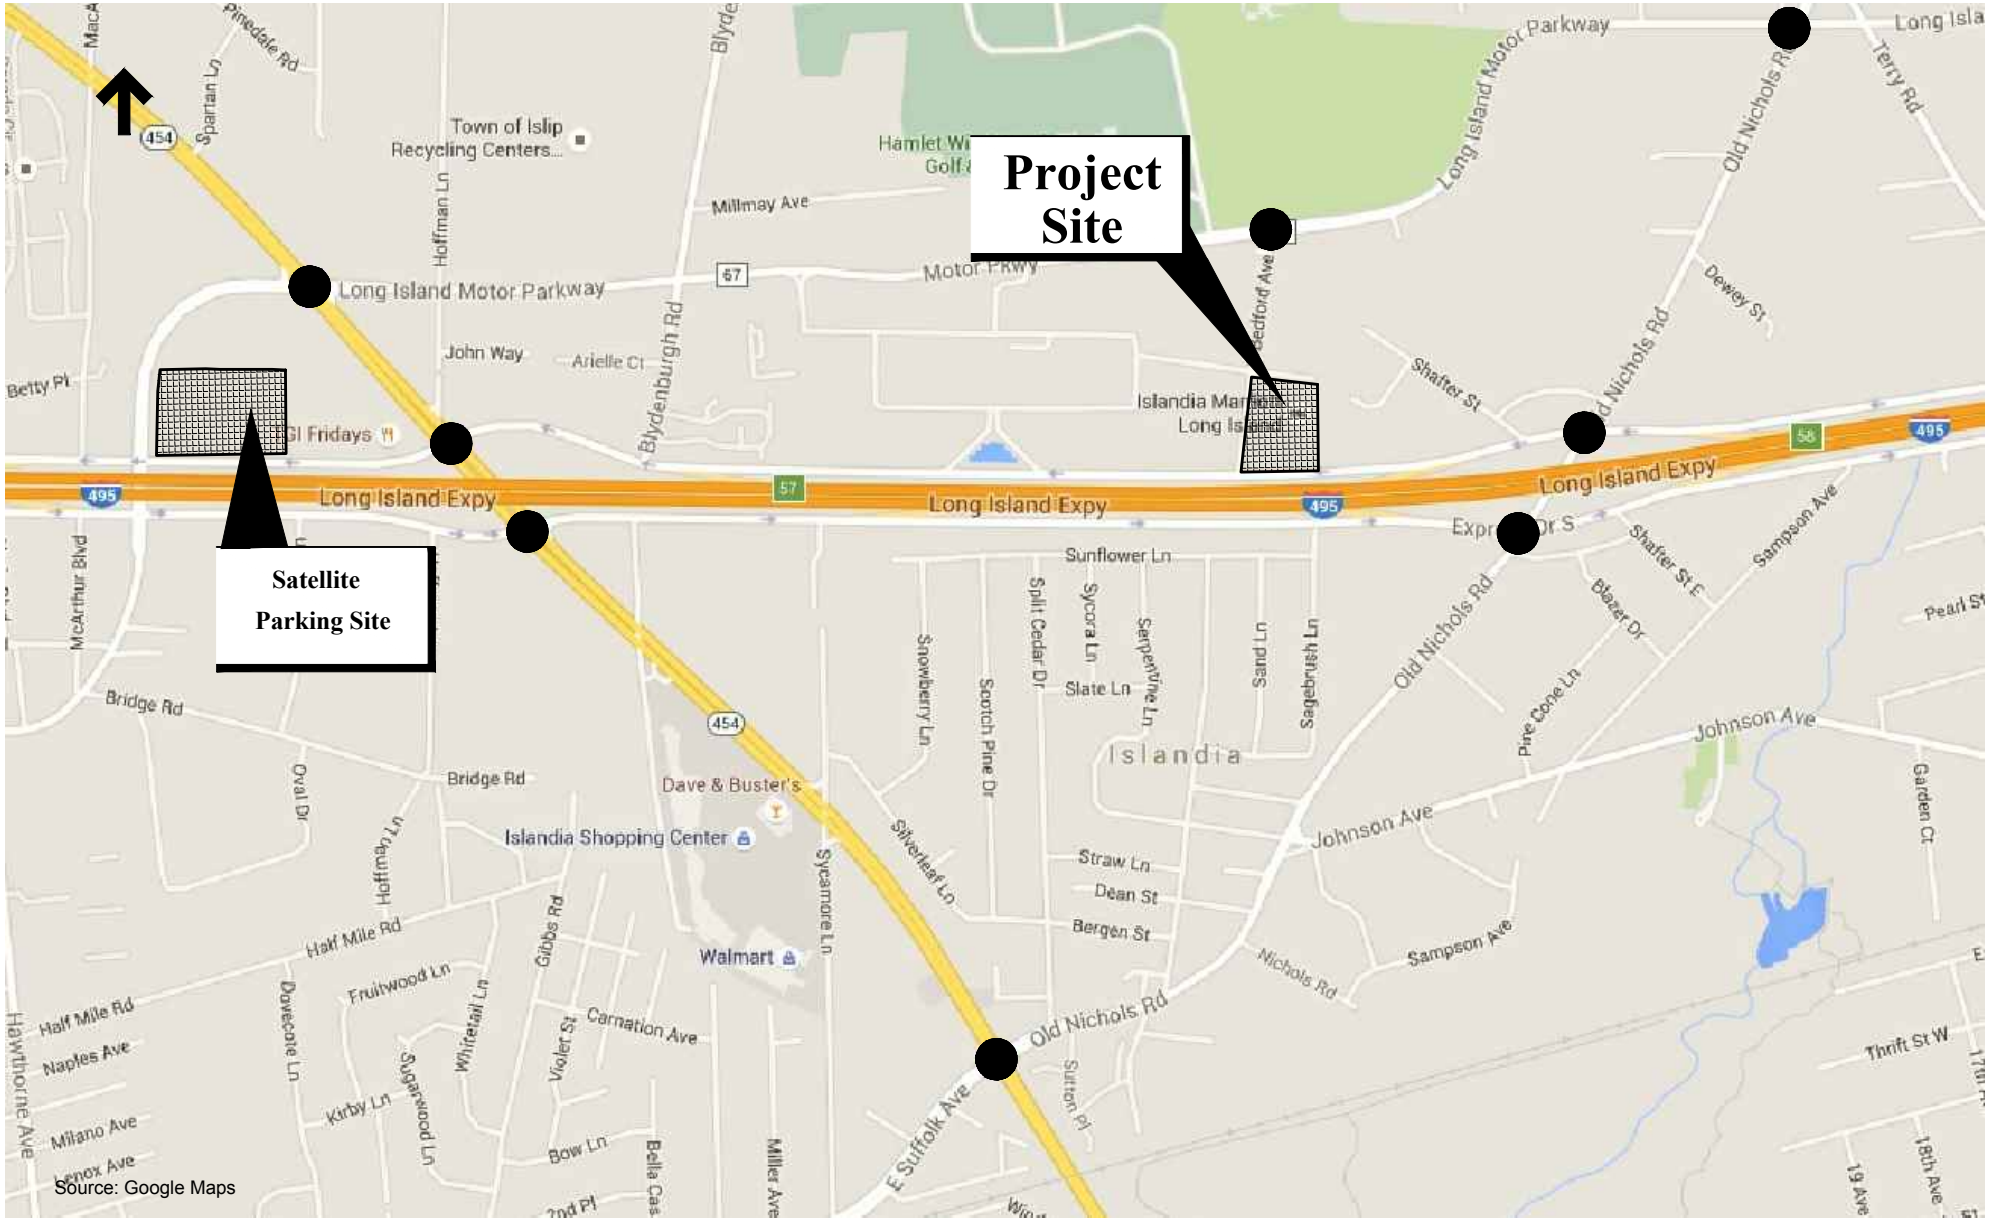

Study Area

To determine the potential traffic impacts of the proposed project, the following study intersections were identified for analysis under the Existing, No-Build and future Build conditions:

- Motor Parkway (CR 67) and Bedford Avenue (Signalized)
- Motor Parkway (CR 67) and Old Nichols Road (Signalized)
- Old Nichols Road and Express Drive North (Signalized)
- Old Nichols Road and Express Drive South (Signalized)
- Motor Parkway (CR 67) and NY 454 (Signalized)
- NY 454 and Express Drive North (Signalized)
- NY 454 and Express Drive South (Signalized)
- NY 454 and Old Nichols Road / Suffolk Avenue (Signalized)

The study intersections are shown on Figure 2. Aerial views of the intersections and descriptions of same are included below.

Figure 2
Study Intersections

Marriott
Islandia, New York

Motor Parkway (CR 67) and Bedford Avenue

Motor Parkway (CR 67) and Bedford Avenue is a signalized three-legged intersection. CR 67 runs east-west, and provides an exclusive left-turn lane and two through lanes in the westbound direction. In the eastbound direction CR 16 provides one through lane and a shared through/right-turn lane. The northbound Bedford Avenue provides a left-turn lane and a right-turn lane. It should be noted that the above aerial photograph depicts that there are not individual right and left turn lanes on this approach, however it was confirmed by a field visit that the approach has been since been striped with individual turn lanes. The intersection is controlled by a two phase, semi-actuated traffic signal.

Motor Parkway (CR 67) and Old Nichols Road

CR 67 and Old Nichols Road is a signalized four-legged intersection. CR 67 runs east-west, and provides an exclusive left-turn lane, one through lane, and a channelized right-turn lane controlled by the signal in the eastbound direction. Eastbound right-turns on red are restricted at this location. In the westbound direction, CR 67 provides an exclusive left-turn lane and a shared through/right-turn lane. The northbound Old Nichols Road provides an exclusive left turn lane, one through lane and a right-turn lane. Southbound Old Nichols Road provides a through and a right-turn lane. Southbound left-turns are restricted at this location. The intersection is controlled by a two phase, semi-actuated traffic signal.

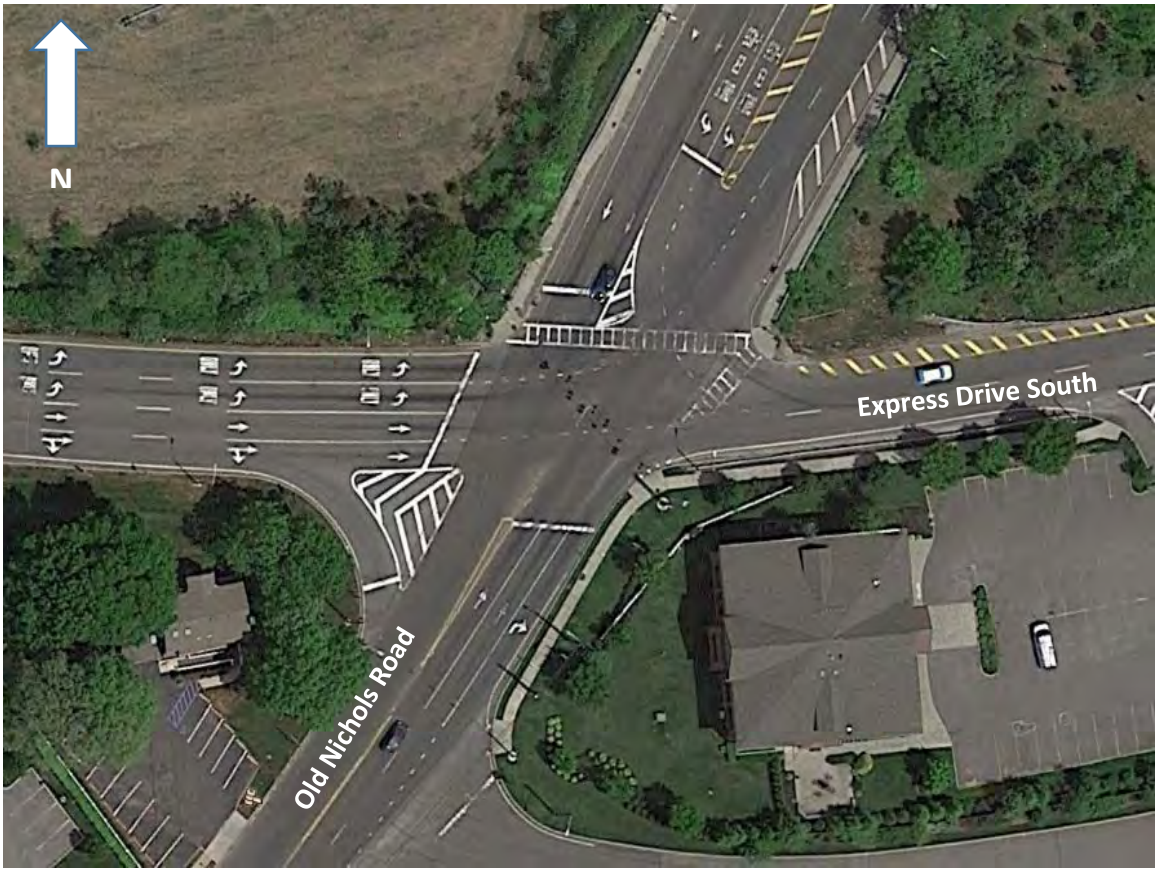

Old Nichols Road and Express Drive North

Old Nichols Road and Express Drive North is a signalized four-legged intersection with three active approaches. Express Drive North is one-way and allows westbound traffic only. It provides two exclusive left-turn lanes, two through lanes and a shared through/right-turn lane in the westbound direction. Northbound Old Nichols Road provides two exclusive left-turn lanes and two through lanes. The southbound Old Nichols Road provides two through lanes, a shared through/right-turn lane and an exclusive right-turn lane. Southbound right-turns on red are restricted at this intersection. The intersection is controlled by a multi-phase, actuated traffic signal. The intersections at Express Drive North and at Express Drive South are coordinated. The phasing is as follows:

- Westbound phase
- North-south through/right-turn phase
- Northbound lagging and protected left-turn phase with through movement

Old Nichols Road and Express Drive South

Old Nichols Road and Express Drive South is a signalized four-legged intersection with three active approaches. Express Drive South is one-way and allows eastbound traffic only. It provides two exclusive left-turn lanes, one through lane and a shared through/right-turn lane in the eastbound direction. The right-turns are channelized. Northbound Old Nichols Road provides two through lanes and an exclusive right-turn lane. Southbound Old Nichols Road provides two exclusive left-turn lanes and two through lanes. Northbound bound right-turns on red are restricted at this intersection. The intersection is controlled by a multi-phase, actuated traffic signal. The intersections at Express Drive North and at Express Drive South are coordinated. The phasing is as follows:

- Eastbound phase
- North-south through/right-turn phase
- Southbound lagging and protected left-turn phase with through movement

NY 454 and Motor Parkway (CR 67)

NY 454 and Motor Parkway is a signalized four-legged intersection. CR 67 runs east-west, and provides an exclusive left-turn lane, two through lanes, and an exclusive right-turn lane in both directions. East/West right-turns on red are restricted at this location. Northbound NY 454 provides an exclusive left turn lane, two through lanes and a channelized right-turn lane controlled by a yield sign. Southbound NY 454 provides two exclusive left-turn lanes, two through lanes and a channelized right-turn lane controlled by a yield sign. The intersection is controlled by a multi-phase actuated signal. The phasing is as follows:

- North-south protected left-turn phase with westbound right-turns overlap
- North-south through/right-turn phase
- Eastbound protected left-turn and through phase
- East-west through/right-turn phase with permitted left-turns

NY 454 and Express Drive North

NY 454 and Express Drive North is a signalized four-legged intersection with three active approaches. Express Drive North is one-way and allows westbound traffic only. It provides an exclusive left-turn lane, two through lanes, a shared through/right-turn lane and an exclusive right-turn lane in the westbound direction. Northbound NY 454 provides two exclusive left-turn lanes and three through lanes. The southbound NY 454 provides four through lanes and a shared through/right-turn lane. Westbound right-turns on red are restricted at this intersection. The intersection is controlled by a multi-phase, actuated traffic signal. The intersections at Express Drive North and at Express Drive South are coordinated. The phasing is as follows:

- Westbound phase
- North-south through/right-turn phase
- Northbound lagging and protected left-turn phase with through movement

NY 454 and Express Drive South

NY 454 and Express Drive South is a signalized four-legged intersection with three active approaches. Express Drive South is one-way and allows eastbound traffic only. It provides a shared left-turn/through lane, one through lane, a shared through/right-turn lane and an exclusive right-turn lane in the eastbound direction. Northbound NY 454 provides four through lanes and a shared through/right-turn lane. Southbound NY 454 provides two exclusive left-turn lanes and three through lanes. Northbound bound right-turns are channelized with a yield control. The intersection is controlled by a multi-phase, actuated traffic signal. The intersections at Express Drive North and at Express Drive South are coordinated. The phasing is as follows:

- Eastbound phase
- North-south through/right-turn phase
- Southbound lagging and protected left-turn phase with through movement

NY 454 and Old Nichols Road / Suffolk Avenue (CR 100)

NY 454 and Old Nichols Road/ Suffolk Avenue (CR 100) is a signalized four-legged intersection. Westbound Old Nichols Road provides an exclusive left-turn lane, one through lane, and a right-turn lane. Eastbound CR 100 provides an exclusive left-turn lane, two through and a free channelized right-turn lane. The north-south approaches of NY 454 provide an exclusive left turn lane, two through lanes and a right-turn lane in both directions. The southbound right-turns are channelized and free. The intersection is controlled by a two phase, semi-actuated traffic signal.

The phasing is as follows:

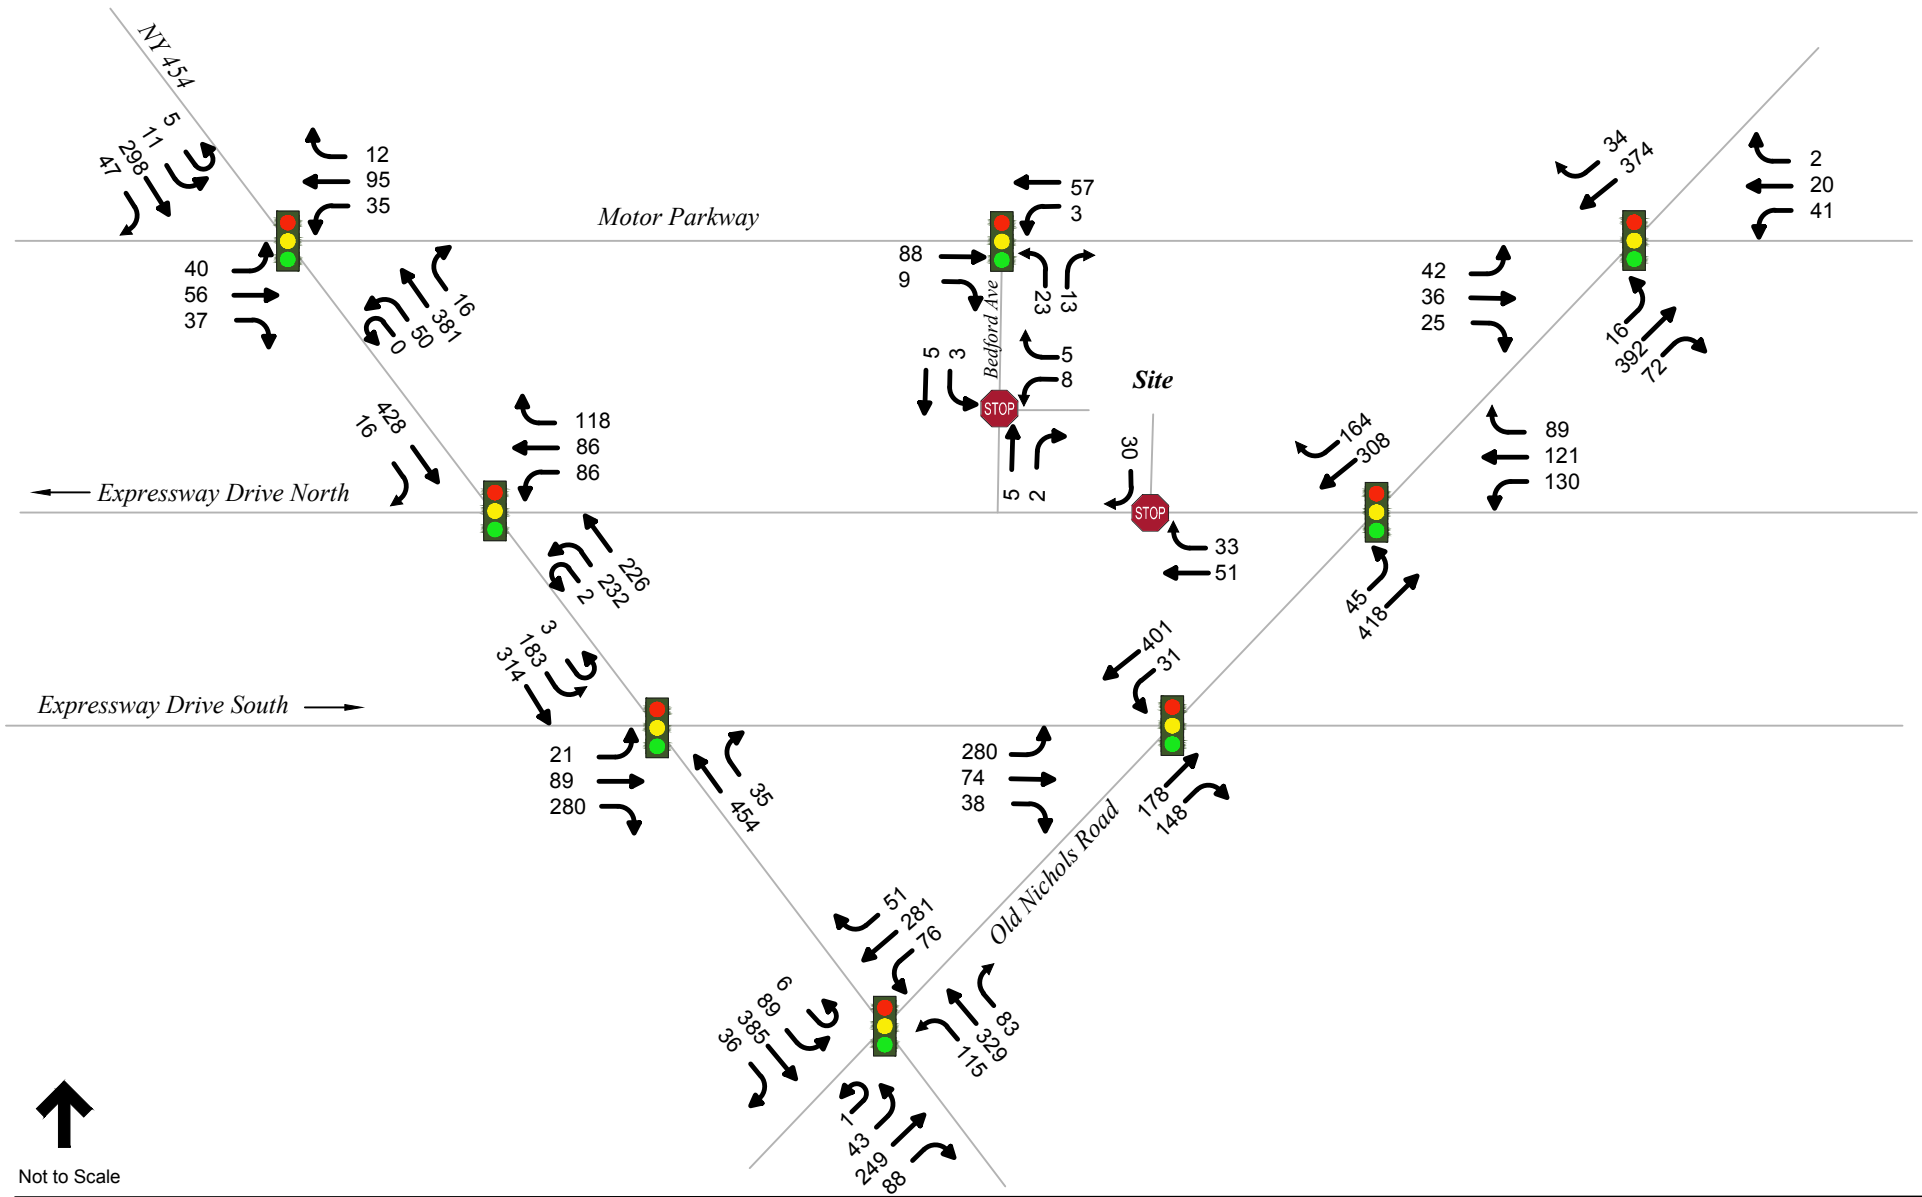

- East-west protected left-turn phase
- East-west through/right-turn phase with permitted left-turns
- North-south protected left-turn phase
- North-south through/right-turn phase with permitted left-turns

Existing Traffic Volume Data

At the eight study intersections, turning movement counts were collected using Miovision cameras on Friday, May 6, 2016 from 8:00 p.m. to 10:00 p.m. and again on Saturday, May 7, 2016 from 8:00 p.m. to 10:00 p.m. These times reflect the heaviest traffic flows for the activity at the site under the proposal. The existing Friday p.m. and Saturday p.m. volumes are shown in Figures 3 and 4. The turning movement counts can be found in Appendix A.

In addition to the above, driveway counts at the existing hotel site were collected using Miovision cameras on Friday, May 13, 2016 from 8:00 p.m. to 10:00 p.m. and again on Saturday, May 14, 2016 from 8:00 p.m. to 10:00 p.m. Ideally these counts would have been conducted to coincide with the other turning movement counts described above. However, the study of the site driveway was later added to the scope of the study and the counts were conducted the following week. Based upon information obtained from the hotel there were no significant events that were held during either of the study periods.

Considering the nature of the development, the traffic volumes, peak hour factors and heavy vehicle percentages for the peak hour 8:00 p.m. to 9:00 p.m. were used in the analysis.

Accident History

Accident data from New York State Department of Transportation (NYSDOT) Accident Location Information System (ALIS) records for the most recent available three-year period were requested. Accident Verbal Description Reports (VDRs) for the period January 1, 2013 through December 31, 2015 were obtained for the eight study intersections and the roadway segments between the intersections in the study area. The VDRs can be found in Appendix B.

Table 1 below provides a summary of the available most recent 3-year history at the study intersections accidents.

Table 1 - Accident Data Summary – Study Intersections

Intersection	Accident Severity				Total	Accident Type									
	Fatality	Injury	Property Damage Only	Non-Reportable		Rear End	Overtaking	Right Angle	Left Turn	Right Turn	Fixed Object	Head On	Pedestrian	Backing	Other/ Unknown

Intersections**:**

At Motor Parkway and Bedford Avenue, during the three-year study period a total of 3 accidents were reported to have occurred. There were no fatalities, 1 accident resulted in personal injury and 2 accidents resulted in property damage only. There was 1 left-turn accident and 2 accidents were classified as other/ of unknown type.

At Motor Parkway and Old Nichols Road, a total of 20 accidents were reported to have occurred. There were no fatalities, 8 accidents resulted in personal injury and 12 accidents resulted in property damage only. The accident types with the highest incident rate were rear end collisions (7 accidents – 35%) and right angle collisions (6 accidents – 30%). 1 accident was classified as other/ of unknown type. A further review of the right angle accidents showed no pattern of right angle collisions. The VDRs show that they occurred since the "traffic control devices were disregarded".

At Old Nichols Road and Express Drive North, a total of 24 accidents were reported to have occurred. There were no fatalities, 10 accidents resulted in personal injury, 12 accidents resulted in property damage only and 2 accidents were classified as non-reportable. The accident types with the highest incident rate were collisions while overtaking (8 accidents – 33%) and rear end collisions (8 accidents – 33%). 5 accidents were classified as other/ of unknown type.

At Old Nichols Road and Express Drive South, a total of 14 accidents were reported to have occurred. There were no fatalities, 9 accidents resulted in personal injury, 4 accidents resulted in property damage only and 1 accident was classified as non-reportable. The accident types with the highest incident rate were rear end collisions (8 accidents – 57%). 2 accidents were classified as other/ of unknown type.

At NY 454 and Motor Parkway, a total of 46 accidents were reported to have occurred. There were no fatalities, 18 accidents resulted in personal injury and 28 accidents resulted in property damage only. The accident types with the highest incident rate were rear end collisions (19 accidents – 41%) and left-turn collisions (9 accidents – 20%). 10 accidents were classified as other/ of unknown type.

At NY 454 and Express Drive North, a total of 21 accidents were reported to have occurred. There were no fatalities, 10 accidents resulted in personal injury and 11 accidents resulted in property damage only. The accident types with the highest incident rate were collisions while overtaking (5 accidents – 24%) and left-turn collisions (5 accidents – 24%). 6 accidents were classified as other/ of unknown type.

At NY 454 and Express Drive South, a total of 50 accidents were reported to have occurred. There were no fatalities, 24 accidents resulted in personal injury, 23 accidents resulted in property damage only and 3 accidents were classified as non-reportable. The accident types with the highest incident rate were rear end collisions (16 accidents – 32%) and left-turn accidents (8 accidents – 16%). 14 accidents were classified as other/ of unknown type.

At NY 454 and Old Nichols Road / Suffolk Avenue, a total of 67 accidents were reported to have occurred. There were no fatalities, 33 accidents resulted in personal injury, 31 accidents resulted in property damage only and 3 accidents were classified as non-reportable. The accident types with the highest incident rate were rear end collisions (28 accidents – 42%) and left-turn accidents (15 accidents – 22%). 9 accidents were classified as other/ of unknown type.

Table 2 provides a summary of the available most recent 3-year history of accidents on the roadway segments between study intersections.

Table 2 - Accident Data Summary – Roadway Segments

Roadway Segment	Accident Severity				Total	Accident Type									
	Fatality	Injury	Property Damage Only	Non-Reportable		Rear End	Overtaking	Right Angle	Left Turn	Right Turn	Fixed Object	Side-Swipe	Pedestrian	Run Off The Road	Other/ Unknown
Motor Parkway From NY 454 to Old Nichols Road	-	13	17	-	30	3	2	5	9	1	4	-	1	4	1
Express Drive North From Old Nichols Road to NY 454	-	8	16	1	25	3	15	-	-	-	4	-	-	-	3
Express Drive South From NY 454 to Old Nichols Road	-	3	3	-	6	3	1	-	-	-	-	-	-	1	1
Bedford Avenue From Express Drive North to Motor Parkway	-	-	-	-	0	-	-	-	-	-	-	-	-	-	-
NY 454 From Motor Parkway to Old Nichols Road / Suffolk Avenue	-	39	47	7	93	34	25	3	11	4	4	1	6	3	2
Old Nichols Road From Motor Parkway to Express Drive South	-	15	27	3	45	20	5	2	7	1	6	-	1	-	3

On the segment of Motor Parkway – between NY 454 and Old Nichols Road, during the three-year study period a total of 30 accidents were reported to have occurred. There were no fatalities, 13 accidents resulted in personal injury, and 17 accidents resulted in property damage only. The accident types with the highest incident rate were left-turn collisions (9 accidents – 30%) and right angle collisions (5 accidents – 17%). 1 accident was classified as other/ of unknown type.

On the segment of Express Drive North - between Old Nichols Road and NY 454, a total of 25 accidents were reported to have occurred. There were no fatalities, 8 accidents resulted in personal injury, 16 accidents resulted in property damage only, and 1 accident was classified as non-reportable. The accident types with the highest incident rates were collisions while overtaking (15 accidents – 60%) and collisions with fixed objects (4 accidents - 16%). 3 accidents were classified as other / of unknown type.

On the segment of Express Drive South - between NY 454 and Old Nichols Road, a total of 6 accidents were reported to have occurred. There were no fatalities, 3 accidents resulted in personal injury and 3 accidents resulted in property damage only. The accident type with the highest incident rate was rear end collisions (3 accidents – 50%). 1 accident was classified as other / of unknown type.

On the segment of NY 454 - between Motor Parkway and Old Nichols Road / Suffolk Avenue, a total of 93 accidents were reported to have occurred. There were no fatalities, 39 accidents resulted in personal injury, 47 accidents resulted in property damage only and 7 accidents were classified as non-reportable. The accident types with the highest incident rates were rear end collisions (34 accidents – 37%) and collisions while overtaking (25 accidents – 27%). 2 accidents were classified as other / of unknown type.

On the segment of Old Nichols Road - between Motor Parkway and Express Drive South, a total of 45 accidents were reported to have occurred. There were no fatalities, 15 accidents resulted in personal injury and 27 accidents resulted in property damage only and 3 accidents were classified as non-reportable. The accident types with the highest incident rates were rear end collisions (20 accidents – 44%), left-turn collisions (7 accidents – 16%) and collisions with fixed objects (6 accidents – 13%). 3 accidents were classified as other / of unknown type.

Accident Rate Comparison

The accident rate for each of the study intersections, and roadway segments between them that would receive site generated traffic were calculated utilizing the following formulas and then compared to the State-wide average rates. The results were then summarized and presented in Table 3 on the following page.

Intersection Accident Rate Formula:

$$\text{(Accidents per million entering vehicles)} = \frac{\text{Total Number of Accidents x 1,000,000}}{\text{365 days x 3 yrs x Peak Hour Entering veh.}}$$

Segment Accident Rate Formula:

$$\text{(Accidents per million vehicle miles)} = \frac{\text{Total Number of Accidents x 1,000,000}}{\text{365 days x 3 yrs x AADT x Length of Segment (miles)}}$$

Table 3 – Accident Rate Comparison Table

Intersection/ Segment	Location	No. of crashes	Traffic volumes (veh.)	Length of Segment (miles)	Calculated Crash Rate	State-wide Avg. Crash Rate
Segment	Motor Parkway From NY 454 to Old Nichols Road	30	10,832[1]	2.2	**1.15**	**3.81**
Intersection	Motor Parkway & Old Nichols Road	20	21,683[1]	-	**0.84**	**0.23**
Intersection	Motor Parkway & Bedford Avenue	3	11,162[1]	-	**0.25**	**0.15**
Segment	Bedford Avenue From Express Drive North to Motor Parkway	0	400[2]	0.31	**0.00**	**2.81**
Segment	Old Nichols Road From Motor Parkway to Express Drive South	43	15,935[1]	1.71	**1.44**	**3.81**
Intersection	Old Nichols Road & Express Drive North	24	24,860[1]	-	**0.88**	**0.23**
Intersection	Old Nichols Road & Express Drive South	14	24,460[1]	-	**0.52**	**0.23**
Segment	Express Drive North From Old Nichols Road to NY 454	25	3,434[1]	1.45	**4.59**	**3.01**

Intersection	NY 454 & Motor Parkway	46	42,314[1]	-	**0.99**	**0.23**
Segment	NY 454 From Motor Parkway to Old Nichols Road/E. Suffolk Avenue	93	32,185[1]	1.32	**2.00**	**4.43**
Intersection	NY 454 & Old Nichols Road	67	59,926[1]	-	**1.07**	**0.23**

As seen in the Table 3 above, all intersection accident rates were higher than state-wide average crash rate. VHB regularly conducts crash analyses for governmental agencies and has found that intersection crash rates in general on Long Island, including Suffolk County, are typically much higher than the State-wide average rates. This is likely due to the unique roadway characteristics in the area, and how they differ from many other roadways in other parts of the State, in particular the "Upstate" region where the majority of the roadways taken into account in these statistics exist. A more reasonable comparison would be one where the crash rates are compared to other rates for intersections within the same County, however such

rates are not available for comparison purposes. It should also be noted that these State-wide rates are typically used to identify intersections with the highest crash rates so they can be more closely studied and not to compare one intersection to another.

As can be seen by the data, as the intersection volume increase at a location, the number of accidents also increases. Therefore, it would be expected that the intersection of NY 454 at Nichols Road would have the highest number of intersection accidents since it has the highest intersection volume. In fact, the volume at that intersection is 18% higher or more than all the other study intersections.

In addition to the intersection crash rates, a review was also made for each of the 6 individual roadway segments. With the exception of the roadway segment of the North Service Road of the LIE between NY 454 and Old Nichols Road, all crash rates were lower than State-wide average rates. Again a more reasonable comparison would be to compare the rates to other segments within the same County, but such statistics are not available.

Since the roadway segment of the North Service Road of the LIE between NY 454 and Old Nichols Road had a higher than average crash rate a closer look at the accident history was made. Based upon our review of the 25 accidents all of the accidents had contributing factors related to driver error and are not indicative of safety issues along this segment of roadway. A detailed summary of the accidents and the contributing factors at this location has been include in Appendix B.

3

Future Conditions

The analysis of future conditions, with and without the proposed project ("Build" and "No-Build" conditions, respectively), was performed to evaluate the effect of the proposed project on future traffic conditions in the area. Background traffic volumes in the study area were projected to the year 2017, reflecting the year when the project is expected to be completed and operational. The No-Build Condition represents the future traffic conditions that can be expected to occur, even if the proposed project is not constructed. The No-Build Condition serves as a comparison to the Build Condition, which represents expected future traffic conditions resulting from both project and non-project generated traffic.

No-Build Condition

No-Build traffic volumes include all existing traffic and any new traffic due to background traffic growth and any other significant planned developments in the immediate vicinity of the project site.

Background Traffic Growth

To account for increases in general population and background growth not related to the proposed project or the other identified planned developments (discussed above), an annual growth factor was applied to the existing traffic volumes. Based on the NYSDOT, the growth rate anticipated for the Town of Islip, including the Village of Islandia, is 1.2% percent per year. Therefore, the 2016 existing traffic volumes were inflated using the growth factor of 1.2% to the year 2017, when the current project is estimated to be in operation. The resulting inflated volumes were

then added to the traffic generated by the identified other planned development, as discussed in the following section.

Other Planned Development

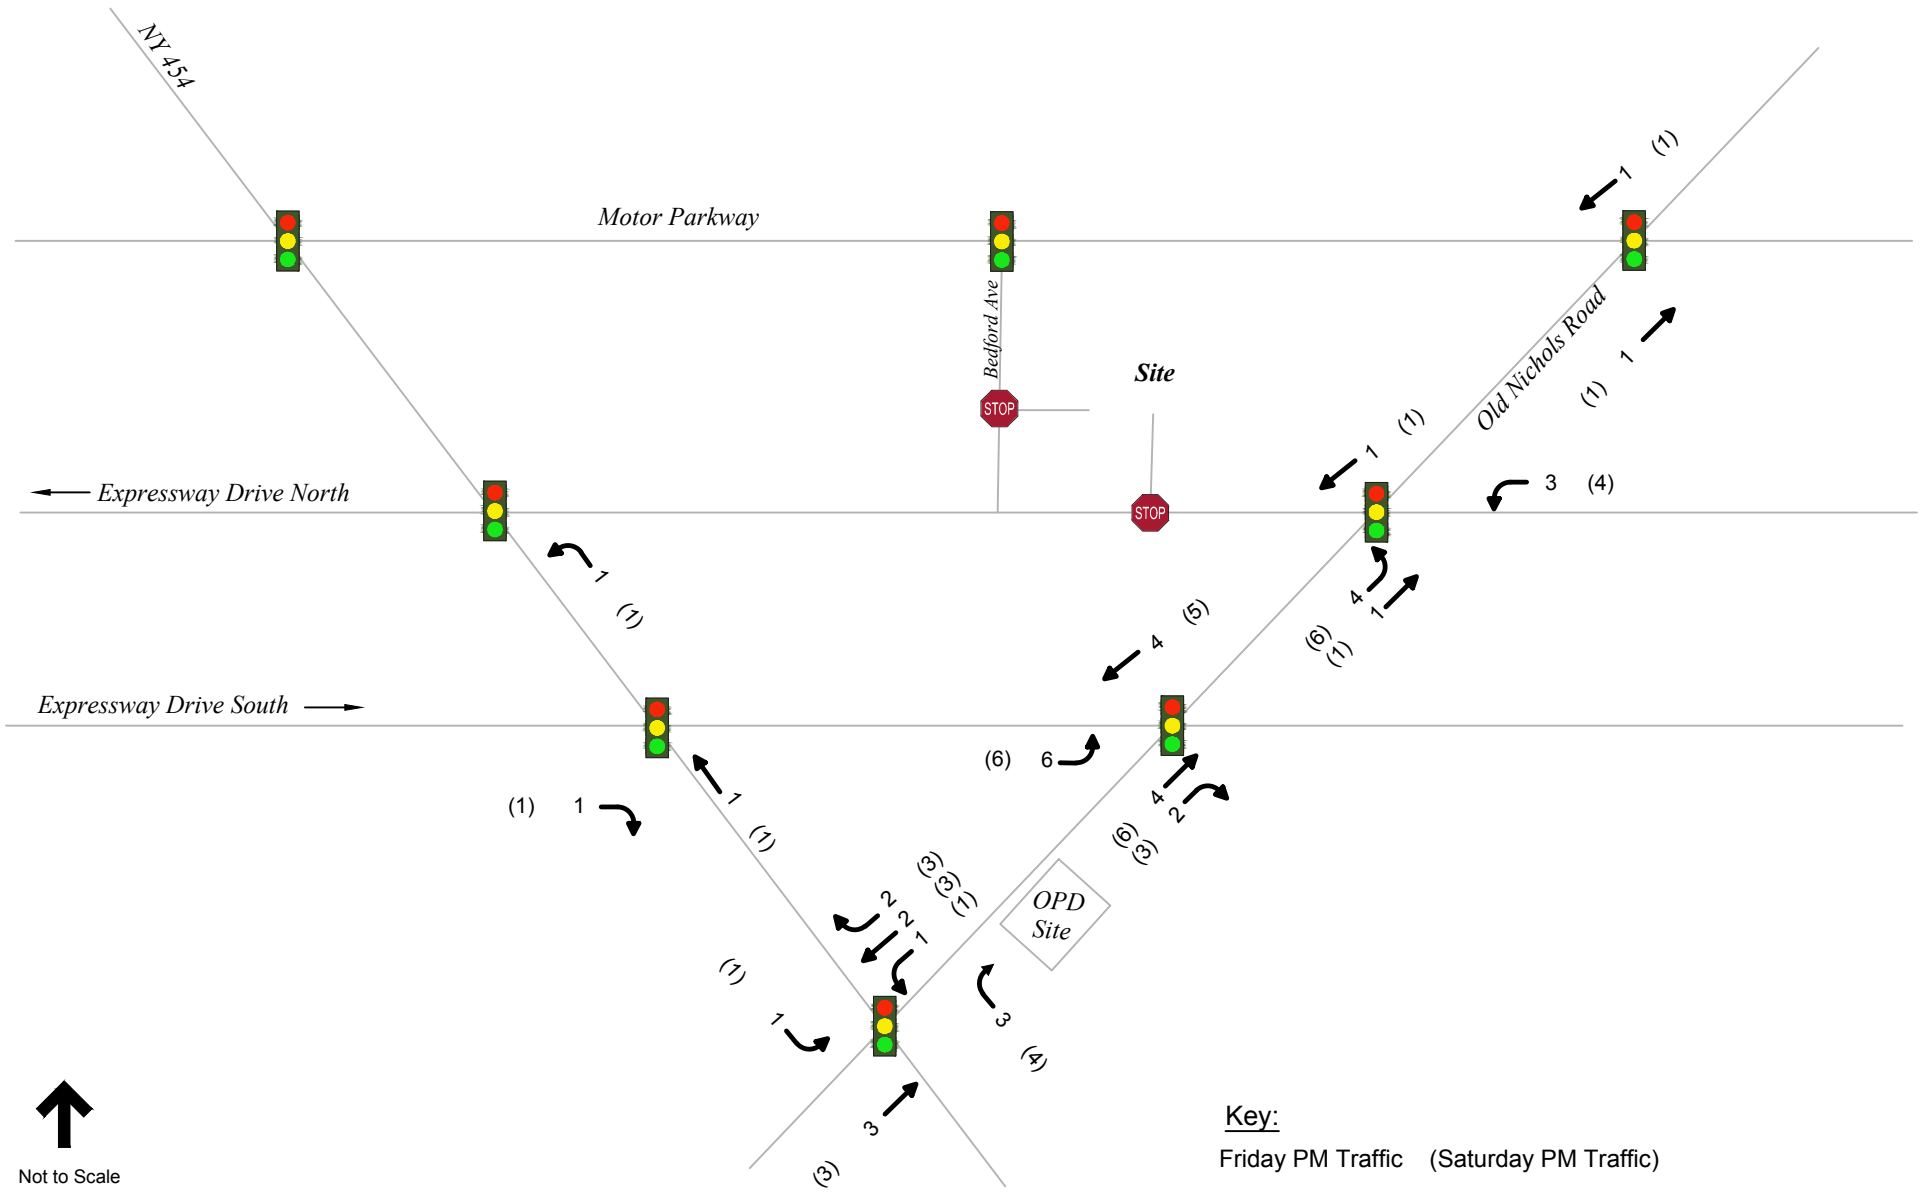

The Village of Islandia was contacted and the following other planned development was identified for inclusion in the analysis. This project is located within the study area and may have a measurable impact on traffic operations at the study intersections:

› The Preserve at Islandia – Located on the east side Old Nichols Road northeast of NY 454, this residential development would consist of 47 senior housing units and 25 condominiums. Based upon the Traffic Impact Study prepared by Nelson and Pope dated March 2008, it is estimated that this development would generate 32 trips (Entering 9, Exiting 23) during the a.m. peak hour, 47 trips (Entering 30, Exiting 17) during the p.m. peak hour and 63 trips (Entering 33, Exiting 30) during the Saturday midday peak hour.

The estimated peak hour traffic of the other development occurs during the peak periods of adjacent street traffic. The p.m. peak hour falls normally between 4:00 p.m. and 6:00 p.m. and the Saturday peak hour falls normally between 11:00 a.m. and 2:00 p.m. As the peak hour of the generator that is the focus of this study is between 8:00 p.m. and 10:00 p.m., the estimated trips generated by the other planned development were adjusted to reflect what is off-peak for a residential development. To present a conservative estimate of potential traffic from The Preserve at Islandia during this later time-of-day, 50% of the peak hour traffic projected for that development, in this study, was utilized.

The other planned development traffic for the Friday p.m. peak and Saturday p.m. peak, as noted above, was then assigned to the roadway network and is depicted in Figure 5. To obtain the 2017 No-Build traffic volumes at the study intersections, the trips anticipated to be generated by the other planned development in the area were then added to the traffic inflated for background growth to 2017 level, as discussed in the previous section.

The 2017 No-Build traffic volumes for Friday p.m. and Saturday p.m. analysis hours are shown in Figures 6 and 7, respectively.

Build Condition

Proposed Site Renovations

As discussed previously, DNC has proposed to renovate the interior of the hotel to provide for the following:

- Rooms 245
- Video Lottery Terminals 1,000
- Restaurant & Bar 155 seats
- OTB Quick-Bet Kiosks 2

To accommodate the renovation, 33 guest rooms and approximately 11,850 square feet of meeting and banquet space currently within the hotel will be eliminated, as well as the existing pool area. The restaurant and bar space will be renovated but will contain the same number of seats as in the existing condition.

Project-Generated Traffic Volumes

Typically, in the performance of studies for evaluating potential traffic impacts for land uses such as hotels, peak period trip generation data from published sources, such as the Institute of Transportation Engineers' *Trip Generation Manual* would be utilized. However, peak period vehicle trip generation information for uses such as the one proposed at the Marriott are not available in the *Trip Generation Manual*. For the purposes of this study, peak period trip generation projections were developed using data contained in a study performed previously to evaluate an expansion of the VLT gaming operation at Resorts World Casino located at Aqueduct Raceway in Queens, New York. That study included vehicle and person-trip data collected at an existing VLT operation at Empire City Casino at Yonkers Raceway.

The Aqueduct VLT study considered the installation of 4,500 VLTs at that location, while the Islandia Marriott location is considering only 1,000 machines. In addition, both the Yonkers and Queens locations in the study, are located in urban areas with a great deal of available public transportation. However, the Aqueduct study contains information on person trips which can and was used to develop vehicle trip projections for Islandia. The person trips during peak periods projected for Aqueduct were reduced to account for the smaller number of VLTs proposed in Islandia and then an assumed vehicle occupancy was utilized to generate projected vehicle trips for the Islandia site.

It should be noted that while the Islandia location will include hotel rooms, a restaurant and bar area, as well as two quick-bet kiosks, for the purpose of projecting trip generation, these areas were included in the trip generation projections for the number of VLTs proposed. Based on information from DNC, these other uses within the building will serve a support role to the VLT operation and will not draw visitors to the site that would not already be there to participate in

the gaming operations. In addition, both the Yonkers and Aqueduct casinos include other entertainment opportunities within the buildings that will not be present in Islandia, such as nightclubs and shows/concerts. Based on this, the peak trip generation projections developed from the Aqueduct study are high-side conservative when applied to the Islandia site, which does not have these other uses that would draw patrons beyond the VLT operation. The peak period traffic levels used in this study are higher than what is likely to materialize at the Islandia site.

The Aqueduct Study indicates that arrival and departure activity at VLT operations peak on Friday and Saturday evenings between the hours of 8:00 p.m. and 10:00 p.m. The peak hour site-generated traffic for the proposed project was calculated and combined with the adjacent street traffic for 8:00 p.m. to 9:00 p.m. for analysis. The Aqueduct Study can be found in Appendix C. It should be noted that the peak periods of operation for the site will be in the evening, after the peak traffic levels on the roadways in the area have subsided.

In the determination of the peak hour vehicle trip projections in Table 3 below, the person trip projections for the peak periods in the Aqueduct Study were reduced to account for the smaller number of VLTs (22% of Aqueduct's 4,500 machines) and then divided by a projected vehicle occupancy of 1.75 persons per vehicle. The vehicle occupancy assumption is also conservative as generally vehicle occupancy at entertainment uses is over 2.0.

Table 4 summarizes the anticipated trip generation for the project upon completion.

Table 4 - Projected Trip Generation

	Friday PM Peak Hour		Saturday PM Peak Hour	
Component	Entering	Exiting	Entering	Exiting
Person Trips from Aqueduct Study	3459	1959	3858	3157
Adjust Person Trips to 22.2% of Aqueduct Study	768	431	856	701
Vehicle Occupancy Conversion Factor Applied	1.75	1.75	1.75	1.75
Resulting Vehicle Trip Generation Projections for Islandia	439	247	490	401
	686		**891**	

As indicated in Table 4, the proposed project is projected to generate 686 trips (entering 439 & exiting 247) during the Friday p.m. peak hour and 891 trips (entering 490 & exiting 401) during the Saturday p.m. peak hour.

Satellite Parking Operations

As noted in the Introduction of this study, the use of a satellite parking lot is no longer part of the scope of the project. The Applicant has decided to implement an on-site valet parking system to accommodate the peak parking demands that would occur on Friday and Saturday evenings. Therefore vehicles will no longer be leaving the site to go to the satellite parking area and shuttle buses will not be transporting patrons to and from the site. Since the use of a satellite parking lot scenario would result in higher traffic generation estimates, more particularly with the number of vehicles exiting the site, the trip projections used in the June 2016 study will

continue to be used in this study for purposes of providing a very high-side conservative analysis.

These trips are summarized in Tables 5 and 6 below.

Table 5 - Primary, Satellite & Shuttle Trips - Friday

Friday PM Peak Hour					
Primary Trips		**Satellite Trips**		**Shuttle Trips**	
Entering	Exiting (80% of total exiting Trips)	Rerouted from Hotel to Satellite Site	Exiting (20% of total exiting Trips)	From Hotel to Satellite Parking Site	From Satellite Parking Site to Hotel
439	198	241	49	6	6
637		290		12	

Table 6 - Primary, Satellite & Shuttle Trips – Saturday

Saturday PM Peak Hour					
Primary Trips		**Satellite Trips**		**Shuttle Trips**	
Entering	Exiting (80% of total exiting Trips)	Rerouted from Hotel to Satellite Site	Exiting (20% of total exiting Trips)	From Hotel to Satellite Parking Site	From Satellite Parking Site to Hotel
490	321	169	80	6	6
811		249		12	

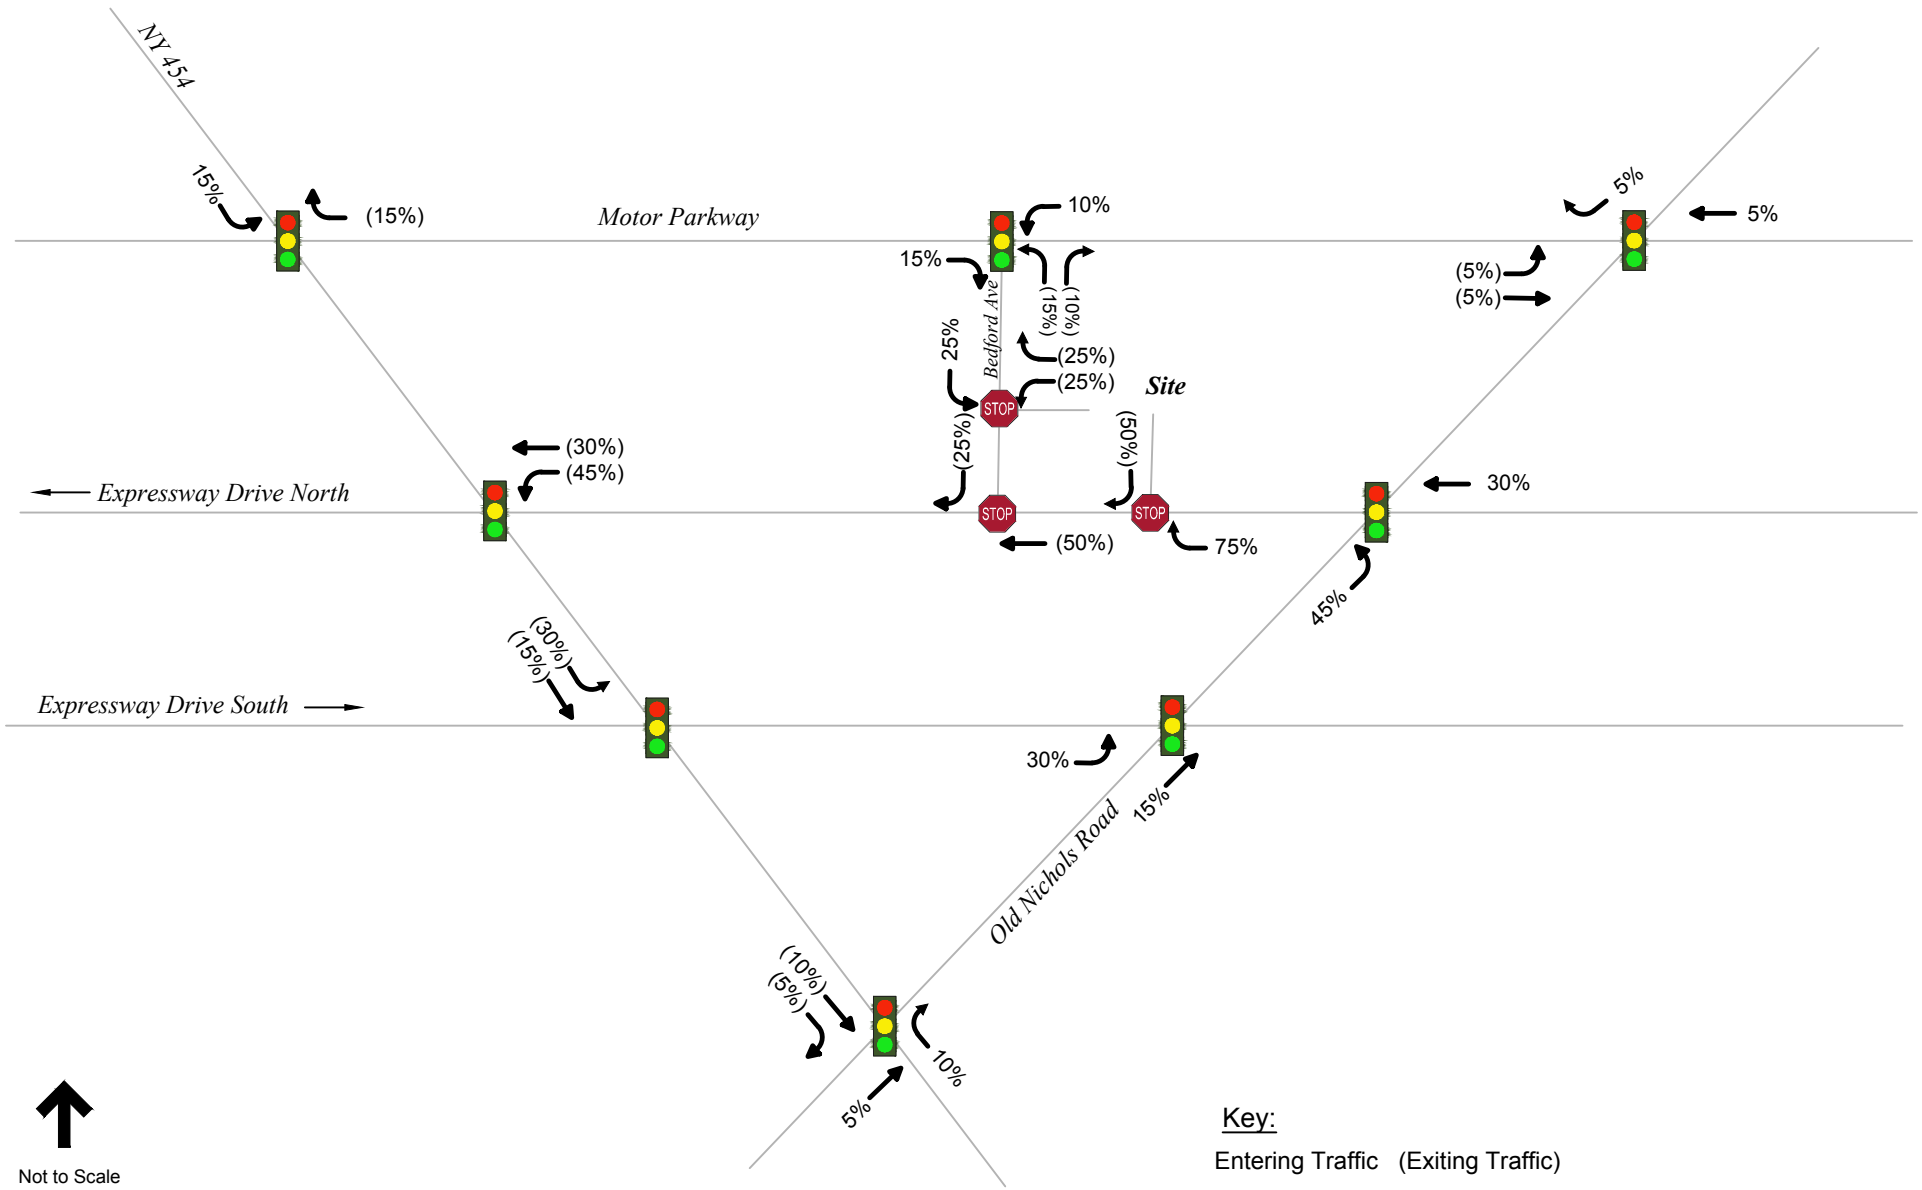

Trip Distribution and Assignment

The trips originating from and destined to the site were assigned to the adjacent roadways based on characteristics of the roadway network, the location of the proposed site access points, existing travel patterns, and likely destination points. The trip distribution percentages for the primary trips are shown in Figure 8. These were then applied to the traffic volumes shown in Tables 5 and 6 for the Friday p.m. and Saturday p.m. peak hours with the resulting trip assignment presented in Figure 9.

The trip distribution percentages for the satellite parking trips and the shuttle trips are shown in Figure 10. These were then applied to the traffic volumes shown in Tables 5 and 6 for the Friday p.m. and Saturday p.m. peak hours with the resulting trip assignment presented in Figure 11.

To determine the future Build Condition traffic volumes, the project-generated trips were added to the No-Build traffic volumes at the key intersections. The resulting Build traffic volumes for the Friday p.m. and Saturday p.m. peak hours are shown in Figures 12 and 13, respectively.

As noted earlier in the Introduction, the satellite parking area has been eliminated from the project. Therefore, the traffic that was directed from the project site to the satellite parking site would be eliminated. As a result, the Build Condition traffic volumes at certain intersections, primarily to the west of the project site are overstated and will be much lower than is presented in this analysis. Therefore this analysis presents a very high-side conservative analysis.

Traffic Operations Analysis

Measuring existing traffic volumes and projecting future traffic volumes quantifies traffic flow within the study area. To assess the quality of traffic flow, roadway capacity analyses were conducted with respect to the Existing, No-Build and future Build conditions. These capacity analyses provide an indication of the adequacy of the roadway facilities to serve the anticipated traffic demands.

Level of Service and Delay Criteria

The evaluation criteria used to analyze area intersections, in this traffic study, are based on the 2000 & 2010 Highway Capacity Manual (HCM). The term 'level of service' (LOS) is used to denote the different operating conditions that occur at an intersection under various traffic volume loads. It is a qualitative measure that considers a number of factors including roadway geometry, speed, travel delay and freedom to maneuver. Level of service provides an index to the operational qualities of a roadway segment or an intersection. Level of service designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst operating conditions.

In addition to LOS, vehicle delay time (expressed in seconds per vehicle) is typically used to quantify the traffic operations at intersections. For example, a delay of 15 seconds for a particular vehicular movement or approach indicates that vehicles on the movement or approach will experience an average additional travel time of 15 seconds. It should be noted that delay time has a range of values for a given LOS letter designation. Therefore, when evaluating intersection capacity results, in addition to the LOS, vehicle delay time should also be considered.

The level of service designations, which are based on delay, are reported differently for signalized and unsignalized intersections. For signalized intersections, the analysis considers the operation of all traffic entering the intersection and the LOS designation is for overall conditions at the intersection. For unsignalized intersections, however, the analysis assumes that traffic on the mainline is not affected by traffic on the side streets. Thus, the LOS designation is for the critical movement exiting the side street, which is generally the left-turn, out of the side street or side driveway.

It should be noted that the analytical methodologies typically used for the analysis of unsignalized intersections use conservative parameters such as long critical gaps. Actual field observations indicate that drivers on minor streets generally accept shorter gaps in traffic than those used in the analysis procedures, and therefore, experience less delay than reported by the analysis software. The analysis methodologies also do not take into account the beneficial grouping effects caused by nearby signalized intersections. The net effect of these analysis procedures is the over-estimation of calculated delay at unsignalized intersections in the study area. Cautious judgment should therefore be exercised when interpreting the capacity analysis results at unsignalized intersections.

The level of service (LOS) definitions for both the signalized and unsignalized intersections can be found in Appendix D of the report.

Software

The capacity analyses were done using the traffic analysis software Synchro, version 9, a computer program developed by Trafficware Ltd. Synchro is a complete software package for modeling and optimizing traffic signal timing. Synchro adheres to and implements the guidelines and methods set forth in the 2000 Highway Capacity Manual and the 2010 Highway Capacity Manual. This analysis methodology was used to evaluate the ability of an intersection or roadway to efficiently handle the number of vehicles using the facility. Synchro was used to model and analyze the Existing, No-Build and Build conditions at the key intersections.

Level of Service Analysis

LOS analyses were conducted for the Existing, No-Build and future Build conditions for the key signalized study intersections and for the unsignalized site access points. The analyses were conducted utilizing signal timings obtained from both the New York State Department of Transportation and the Suffolk County Department of Public Works. The signal timings were reviewed and the appropriate off-peak schemes were utilized for this analysis.

The peak hour traffic volumes during the hour 8:00 p.m. to 9:00 p.m. was used as the base for all the study intersections.

Signalized Intersection Analysis Results

The results of the capacity analyses for the following signalized intersections in Existing, No-Build and future Build conditions are summarized in Tables 7 and 8 below, for Friday p.m. and Saturday p.m. periods, respectively.

- Motor Parkway (CR 67) and Bedford Avenue (Signalized)
- Motor Parkway (CR 67) and Old Nichols Road (Signalized)
- Old Nichols Road and Express Drive North (Signalized)
- Old Nichols Road and Express Drive South (Signalized)
- Motor Parkway (CR 67) and NY 454 (Signalized)
- NY 454 and Express Drive North (Signalized)
- NY 454 and Express Drive South (Signalized)
- NY 454 and Old Nichols Road / Suffolk Avenue (Signalized)

The detailed capacity analysis worksheets are contained in Appendix E.

Table 7 shows that during the Friday p.m. peak, all eight signalized study intersections operate well and consistent with the No-Build levels. There is no change in level-of-service at the study intersections from No-Build to Build condition, except at NY 454 and Express Drive South. The LOS at this intersection moved from B in the No-Build Condition to C in the Build condition, with the overall intersection delay increasing by only 2.4 seconds.

	Overall		**28.1**	**C**	**28.3**	**C**	**27.8**	**C**

Table 8 shows that during the Saturday p.m. peak hour, all eight signalized study intersections operate well and consistent with the No-Build levels. There is no change in level-of-service at the intersections from the No-Build to Build condition, except at Old Nichols Road and Express Drive North, NY 454 and Express Drive North and NY 454 and Express Drive South. The LOS at the intersection of Old Nichols Road and Express Drive North moved from B in the No-Build Condition to a C in the Build condition, with the overall intersection delay increasing by only 2.5 seconds. The LOS at the intersection of NY 454 and Express Drive North moved from C in the No-Build Condition to D in the Build condition, with the overall intersection delay increasing by 6.7 seconds. The LOS at the intersection of NY 454 and Express Drive South moved from B in the No-Build Condition to C in the Build condition, with the overall intersection delay increasing by 3.8 seconds. Even with these minor changes, all intersections continue to operate in acceptable levels of service (LOS D or better).

It should be noted that due to the actuation of a traffic signal, in some instances, the green time allocated to a certain movement or approach may be increased, based upon demand. Therefore, intersection delays may actually decrease on that movement because more green time is allocated, and would increase on another movement where less green time is allocated.

The overall intersection delay may also go down as a result of this operation. This is due to the fact that overall intersection delay is based on a weighted average of all the delays on each of the individual movements. If a higher volume movement experiences less delay, the overall intersection delay would actually decrease. Although not always the case, such is the case with the intersections of Motor Parkway at Old Nichols Road and NY 454 at Old Nichols Road/ Suffolk Avenue.

Site Access

The hotel site is served by three access driveways, which all allow for both entering and exiting traffic movements. The primary access point is located on Express Drive North and allows for right-turns into and out of the site, given the one-way nature of the adjacent roadway. A second access point is located on Bedford Avenue, adjacent to the west side of the site and provides full movements into and out of the site. A third, minor access is located north of the site to Kosciusko Street, a dead end village roadway, and provides right-turns into and left-turns out of the site. Kosciusko Street intersects Bedford Avenue off the northwest corner of the site. For the purpose of conservative analysis, the access driveways located on Express Drive North and Bedford Avenue were analyzed.

The results of the unsignalized capacity analysis of the two site access driveways are summarized in Tables 9 and 10 below for Friday p.m. and Saturday p.m. periods, respectively. The detailed capacity analysis worksheets are contained in Appendix E.

Table 9 - Level of Service Summary – Site Accesses – Friday PM

Intersection	Approach	Existing 2016		No-Build 2017		Build 2017	
		Delay	LOS	Delay	LOS	Delay	LOS
Bedford Avenue & Hotel Site Access	WB	8.6	A	8.6	A	13.1	B
	SB L	7.2	A	7.2	A	7.5	A
Express Drive North & Hotel Site Access	SB	8.8	A	8.8	A	16.0	C

Table 10 - Level of Service Summary – Site Accesses – Saturday PM

Intersection	Approach	Existing 2016		No-Build 2017		Build 2017	
		Delay	LOS	Delay	LOS	Delay	LOS
Bedford Avenue & Hotel Site Access	WB	8.5	A	8.5	A	12.4	B
	SB L	7.2	A	7.2	A	7.5	A
Express Drive North & Hotel Site Access	SB	8.8	A	8.9	A	18.2	C

Tables 9 and 10 indicate that the hotel access driveways operate well in the Build condition, with moderate delays to existing traffic. It is noted that the operation of the driveways does not impart any delays to through vehicles on Express Drive North, as exiting vehicles must yield to traffic on the major roadway.

5

Parking and Circulation

Off-Street Parking

Village Parking Requirements

Off-street parking required is outlined on the Parking Schedule in the Village of Islandia Zoning Code (Chapter 177, Attachment 7) which stipulates requirements for hotels, restaurants and bars. Table 11 below outlines the requirements for each of the individual uses.

Table 11 – Table of Off-street Parking Requirements

Use	Requirements Per Zoning Code	Unit	Required Off-Street Parking Spaces	
Restaurant	1 Space per 2 Seats Provided	105 Seats	1 Space Per 2 Seats x 105 Seats =	53 Spaces
	or			
	2 Spaces per 200 GSF Provided, Whichever is Greater	3,206 GSF	2 Spaces per 200 GSF x 3,206 GSF =	33 Spaces
Bar	1 Space per 2 Seats Provided	50 Seats	1 Space Per 2 Seats x 50 Seats =	25 Spaces
	or			
	2 Spaces per 200 GSF Provided, Whichever is Greater, Plus	383 GSF	2 Spaces per 200 GSF x 3,206 GSF =	33 Spaces
	1 Space per 12 GSF of Bar Area	383 GSF	1 Space Per 12 GSF x 383 GSF =	32 Spaces
Hotel	1 Space Per Sleeping Room	245 Rooms	1 Space x 245 Rooms =	245 Spaces
	Plus			
	1 Space Per Each Employee	85 Employees	1 Space x 85 Employees =	85 Spaces
Total Required				**473 Spaces**

Based upon the parking requirements outlined in Table 11 above, the proposed project requires that 473 off-street parking spaces be provided. The existing hotel site provides 649 marked parking stalls according to the ALTA/ ASCM Land Title Survey prepared by Sidney B. Bowne and Son, LLP dated February 2, 2016. This count will be reduced by six spaces to 643, post-renovation. While this level of parking exceeds Village Code by 170 spaces (643 – 473), the proposed operation of the site does not lend itself to direct application of the code in the determination of parking sufficiency. As such, a projection of actual parking demands based on the specifics of the site's proposed operation has been performed.

Estimated Parking Necessary for Post-Renovation Operations

Although the hotel site will continue to meet code requirements with regard to parking provided on-site, the specific nature of the accessory use would result in increased peak period parking demand. To estimate the anticipated actual peak parking demand at the site's, the components of the sites operation were considered.

1000 VLTs – based on a vehicle occupancy of 1.75 persons per vehicle and a fully occupied gaming floor, this component could be expected to generate 571 parked vehicles.

245 Hotel Rooms – Under typical situations, an occupied hotel room would be expected to generate one parked vehicle. However, based on discussions with the Applicant, it is anticipated that the majority of hotel guests will already be at the site for the gaming experience and would have been parked on-site regardless. Therefore, assuming that all hotel rooms are occupied and guests would have been parked at the site regardless of whether or not they had a hotel room, a conservative estimate of one parked vehicle for every two rooms was assumed here, for a total of 123 parked vehicles.

155 Restaurant / Bar Seats – Based on the Village Code, a restaurant would be expected to generate 1 space for every 2 seats provided. However, based on discussions with the Applicant, it is anticipated that the restaurant will be patronized almost exclusively by guests that are there for the gaming experience. As a result these guests would have already been parked on-site and are accounted for in our VLT parking estimates. However we have provided a conservative estimate of one parked vehicle for every six seats, for a total of 26 parked vehicles.

85 Total Staff – The Applicant has indicated that a maximum of 85 staff members will be on-site at any given time. This staff will be allocated for all the uses within the hotel. Based on our experience working on other projects with uses such as hotels and restaurants, we have found that the use of carpooling, public transportation and other non-motorized modes of transportation is very high. Therefore we have utilized a conservative estimate of two parked vehicles for every three staff members, for a total of 56 parked vehicles.

The inclusion of two quick-bet kiosks in the renovation plan is not anticipated to generate any significant level of additional parking demand as, based on

information provided by the applicant, this ancillary component is not expected to attract patrons who are not already there.

Based on the above the total anticipated peak parking demand is expected to be 776 spaces, or roughly between 750 and 800 parked vehicles.

Parking Operations

As noted above, the peak parking demands at the site are expected to approach 800 parked vehicles. Given the provision of 643 marked parking spaces on the hotel site, the demands are likely to approach or exceed supply during peak periods of operation, most notably on Friday and Saturday evenings. To accommodate this parking demand, the project architect has developed a valet parking plan which would allow the site to accommodate up to 827 parking spaces. The plan depicts that the west side of the site would be allocated for parking of valeted vehicles.

Since a valet will be parking the vehicles they can more efficiently utilize the area to maximize parking and would increase the parking capacity of the site by 184 spaces. Valet parking would be available on peak days such as on Fridays and Saturdays or on other days as determined by management. The 56 employees (2/3 of the 85 employees) would be encouraged to utilize valet parking in order to allow for more spaces to be open to the public.

The valet will be located at both the front and rear entrances to the building. All pick-ups and drop-offs will occur at those points, similarly to the way patrons utilize these areas today. When the valet is in operation, the location of the valet drop-off spot will be designated by signage so patrons entering the site are aware this service is offered and can find the drop-off locations.

The valet parking area can accommodate 535 vehicles and the balance of the spaces (292 spaces) will be open to the public for parking. As noted above, utilizing a valet parking system the overall site can accommodate 827 stalls which well exceeds the anticipated peak parking demand of 800 vehicles, which is a very conservative estimate. Since our parking projections are very conservative, there is no need for an off-site satellite parking area. Moreover, since the satellite parking area is no longer required, it also significantly reduces the amount of traffic the project will generate. There is also no longer the need for shuttle buses to transport patrons back and forth between the two lots.

It is also important to note that the Applicant does not intend to offer any type of private transportation service to and from the site for its patrons. Therefore parking spaces to accommodate their own buses, shuttle buses and vans are not required or anticipated. Outside buses, shuttle buses and vans that are contracted by patrons will be allowed to access the site for purposes of pick-ups and drop-offs, however they will not be permitted to stage on site, expect momentarily while they wait for guests to load and unload.

Site Circulation

No changes in site access or internal circulation are proposed as part of the site renovations. The only change to the site are the six spaces being removed near the northeast corner of the building. Even though there are slight modifications to the parking in this area, the site will continue to circulate and function as it does today. The only exceptions to this will be when valet services are offered and the valet parking area is coned off. While this section will be closed off for valet purposes, it will not impact traffic flow on the remaining portions of the site or emergency vehicle access to or around the building. A careful review of the site plan and valet parking plan reveals that the configuration of the parking layout, drive aisles, site access points and internal site roadways will provide for adequate on-site circulation.

6

Conclusions

Based on the results of the analyses conducted for the purpose of this report, VHB's conclusions are:

- The proposed renovations to the hotel will result in increases in traffic generation that can be accommodated by the surrounding street network.
- The peak periods of traffic activity at the site will occur on Friday and Saturday evenings, when the heaviest traffic on the roadway network has subsided.
- All study intersections operate well in the Build condition, with acceptable levels of service (LOS).
- Changes in the LOS at some intersections are reasonable and well within acceptable standards for intersection operation.
- The existing site access points are adequate to provide for the anticipated traffic levels into and out of the site.
- An unsignalized capacity analysis for the hotel access driveway indicates that vehicles will enter and exit the site with moderate levels of delay.
- Since the level of parking provided at the hotel site may not be sufficient to accommodate parking demands during peak periods (primarily Friday and Saturday evening's), a valet parking system will be implemented to maximize the number vehicles that can be accommodated on site. With the use of the valet parking system the peak parking demands can be accommodated on-site, and the off-site satellite parking arrangement is no longer required.

Appendix C

Description

Aqueduct Study

Philip Habib & Associates
Engineers and Planners • 226 West 26th Street • New York, NY 10001 • 212 929 5656 • 212 929 5605 (fax)

TECHNICAL MEMORANDUM

To: **O'Brien & Gere**

From: **Philip Habib/Larry Leung**

Date: **August 30, 2010**
(Revised October 6, 2010)

Re: **Aqueduct Casino Traffic Study Update (PHA No. 0910)**

Background

This technical memorandum provides an assessment of the recently selected plan for Aqueduct VLT operations. The plan is almost identical to the generic plan analyzed in the 2009 traffic study. As per the August 23rd 2010 conference call with NYSOGS and the Genting team, the following assumptions are reflected in the assessment:

- The proposal for 4,500 VLTs is the same as the 2009 study;
- The proposed plan would have over 7,000 parking spaces. This would include an approximately 2,858-space parking garage and the resurfacing of existing at-grade parking spaces;
- The hours of operation would be four hours longer than considered in the 2009 study (2 AM closure extended to 4 AM, and 10AM opening pushed ahead to 8AM); and
- The Pitkin Avenue entrance would no longer be open for either racetrack or casino traffic, but would remain open in the future as a pedestrian route and for emergency vehicle access. The analysis in the 2009 study assumed the Pitkin Avenue entrance would be open to traffic as per existing conditions.

The appendix to this memorandum provides a preliminary site plan for the proposed project.

Also discussed briefly during the conference call were pedestrian/bicycle changes proposed by NYCDOT along Rockaway Boulevard. Figure 1 shows the NYCDOT plan in the Aqueduct study area. As shown in Figure 1, in the vicinity of Aqueduct, NYCDOT proposes to provide refuge islands for pedestrians at those intersections where the existing striped median is not used for a left-turn lane. This would facilitate pedestrian crossings of Rockaway Boulevard,

but would not result in operational changes with respect to traffic flow (e.g., changes to the number of lanes, etc.) at the intersections analyzed in the 2009 traffic study. It should be noted, however, that NYCDOT is also planning to reduce the signal cycle length at intersections along Rockaway Boulevard from 120 seconds to 90 seconds in all periods except the weekday AM peak period. This planned change to signal cycle length is therefore also reflected in the updated analysis of No-Build and Build traffic conditions.

Traffic Analysis

The 2009 travel demand forecast for the VLT installation at Aqueduct was developed from estimates of annual usage at proposed VLT installations around New York State. These estimates were primarily based on the number of gaming positions (i.e., VLTs) that would be provided and the anticipated market for gaming activity in proximity to each venue. The 2009 forecast also utilized data on actual demand at the VLT operation at Yonkers Raceway. Since the number of VLTs to be installed at Aqueduct would remain unchanged under the proposed project, the overall travel demand generated at the site is also expected to remain relatively unchanged from the earlier forecast. With the proposed increase in operating hours, the total number of trips generated by the project would be spread out over more hours of the day, and there would likely be somewhat fewer trips in each peak hour. However, this updated traffic analysis conservatively uses the peak hour travel demand from the 2009 travel demand forecast, and focuses on the effect of the Pitkin Avenue access elimination. The analysis utilizes the most current version of the HCS+ software (Version 5.4).

Figure 2 shows the trip arrival/departure distribution from the 2009 study. As shown in Figure 2, approximately 15 percent of the casino's traffic demand was expected to use the Pitkin Avenue entrance. Figure 3 shows the redistribution of this demand with the Pitkin Avenue entrance closed. As shown in Figure 3, demand at the Aqueduct driveway intersection with Rockaway Boulevard would increase by eight percent, from 35 percent to 43 percent of total demand, with the remaining seven percent distributed to North Conduit Avenue. In addition to the casino traffic redistribution, the existing Aqueduct traffic using Pitkin Avenue was also redistributed to the other entrances. Figure 4 shows the revised incremental traffic flow in the study area which is the sum of both the casino traffic and the Aqueduct traffic diverted from the Pitkin Avenue entrance. Figure 5 shows the 2011 Build condition traffic volumes for each peak hour analyzed.

The traffic capacity analysis was again conducted for the 2011 Build condition based on the revised traffic assignment. The 2011 No-Build condition was unchanged with the exception of the reduction in signal cycle lengths planned by NYCDOT at intersection along Rockaway Boulevard. Table 1 shows the results of the updated analyses of No-Build and Build traffic conditions, while Table 2 shows the specific traffic improvement measures that would be incorporated in the Build condition at three study area intersections on Rockaway Boulevard (at the Aqueduct driveway, at 111th Street, and at Linden Boulevard). As shown in Table 1, with implementation of the improvement measures, there would be no significant adverse traffic impacts based on this updated analysis, similar to the findings of the 2009 traffic study.

Compared to the 2009 study, there would no longer be any traffic improvements needed at the Cross Bay Boulevard/Pitkin Avenue intersection. As shown in Table 2, the traffic

improvement measures (i.e., adjustments to signal timing) at the Rockaway Boulevard/Linden Boulevard intersection would remain unchanged from the 2009 study. At the Aqueduct driveway, the improvement measures would consist of changes to signalization, curbside parking regulations and lane markings, including enforcement of the no standing regulation on the south side of the eastbound approach for a longer period of the day (i.e, beginning at 12 noon instead of 1 pm), and the re-striping of the exit driveway for three lanes. Lastly, Table 2 shows that at the 111th Street intersection, a minor (2-second) signal timing change would be incorporated in NYCDOT's signal timing plan in the Saturday PM peak hour.

Although there would be no significant adverse traffic impacts, it should be noted that the redistribution of Pitkin Avenue traffic would substantially increase the eastbound right-turn volume at the Rockaway Boulevard site entrance, and also decrease the level of service for the westbound left-turn from the boulevard into the project site. Table 1 shows that the eastbound right-turn would be operating at level of service D in the Saturday midday compared to LOS C in the 2009 traffic study. It should also be noted that the exit driveway is required to have three approach lanes at the signal at Rockaway Boulevard, similar to the 2009 study.

Parking

No changes to the findings of the parking analysis are expected due to the proposed project (see Table 3). The 2009 study projected a peak accumulation of approximately 5,000 spaces during the 3-4 PM period on Saturday when peak day Aqueduct horse racing demand overlaps with casino demand. With over 7,000 spaces programmed into the proposed plan, no significant parking impacts are expected as there will be ample capacity provided.

Summary

This updated memo addresses changes to future traffic conditions associated with the current project's new access plan as well as NYCDOT's newly-announced operational traffic changes at intersections along Rockaway Boulevard. The closure of the Pitkin Avenue entrance would affect about 15 percent of all traffic entering Aqueduct, while NYCDOT's changes are primarily operational and intended to enhance pedestrian conditions on the boulevard. With the Pitkin Avenue entrance closed and NYCDOT's planned operational changes, the proposed project – with improvements at three off-site locations – would not result in any significant adverse traffic impacts. However traffic along the Rockaway Boulevard corridor would increase, and some movements at the Aqueduct driveway would have poorer levels of service compared to those forecast in the 2009 study. The future parking supply would be ample to accommodate projected peak demand, and no significant adverse parking impacts are expected.

Figure 1

DOT 's Improvement Plan

Proposal (cont'd)

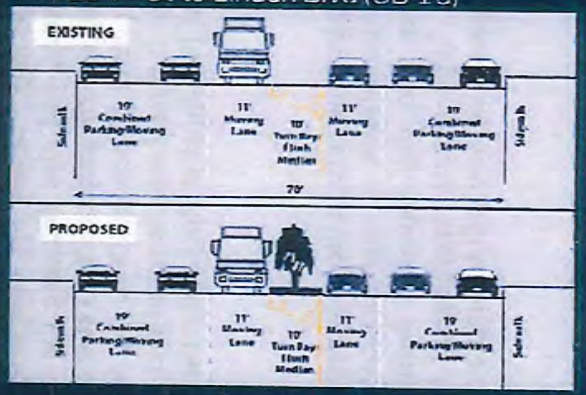

Retain existing configuration from 104th St to Linden Blvd.

Remove one eastbound travel lane from Linden Blvd to Sutphin Blvd

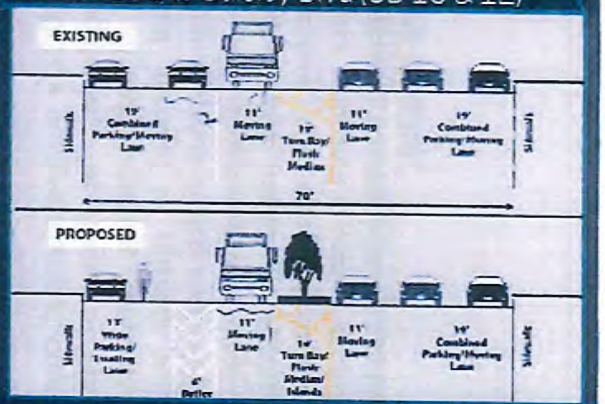

Install pedestrian refuge islands at 13 existing painted median locations.

Reduce signal cycle length to improve travel times and reduce pedestrian and vehicle waiting times

104th St to Linden Blvd (CB 10)

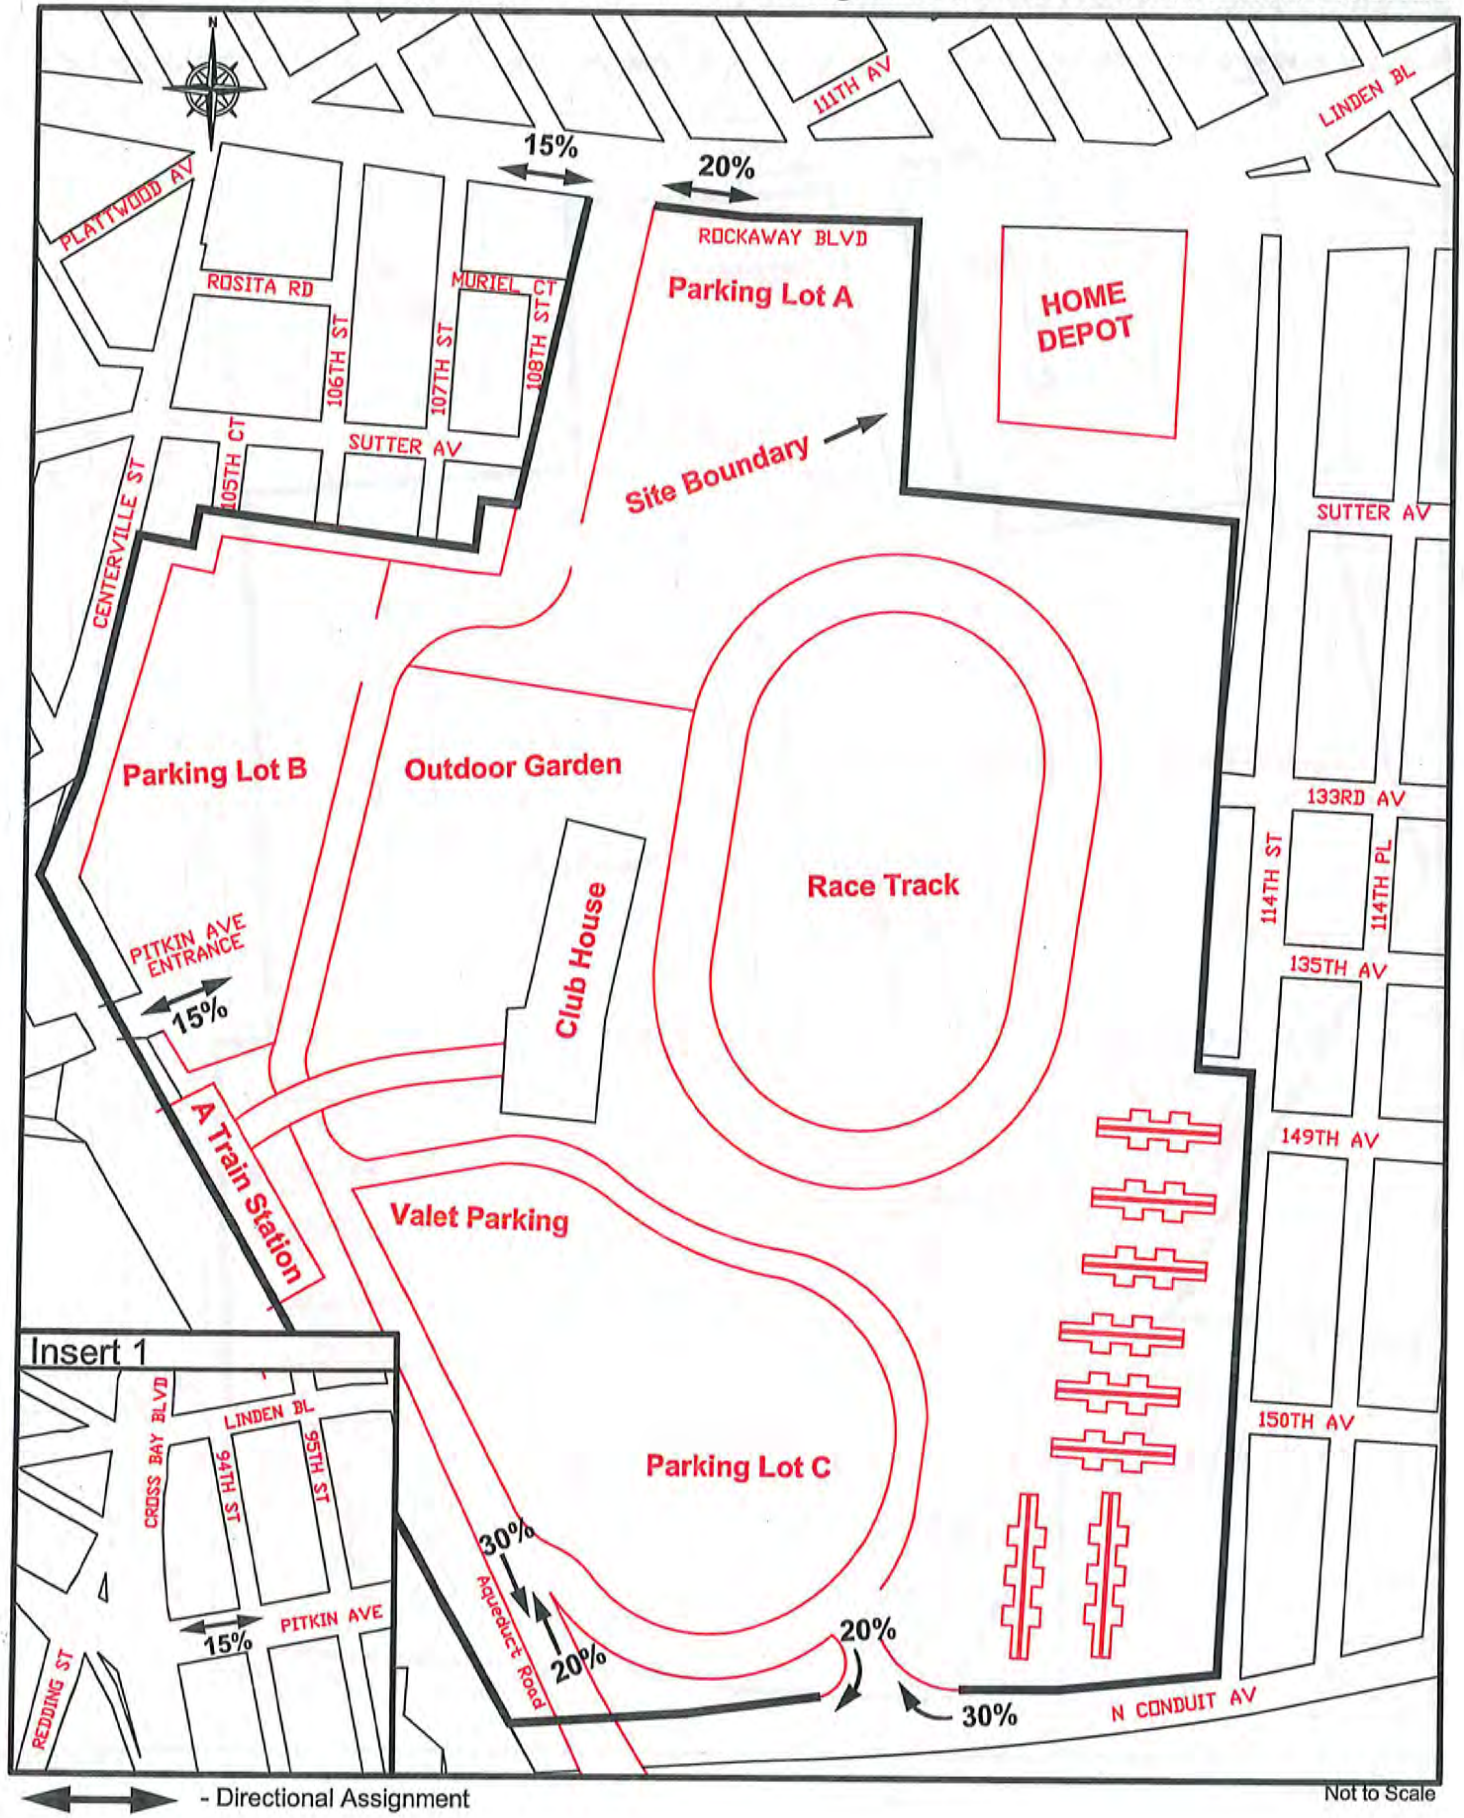

Linden Blvd to Baisley Blvd (CB 10 & 12)

A. INTRODUCTION

This attachment describes the traffic and parking characteristics and potential impacts associated with the Proposed Project, which is the addition of 4,500 video lottery terminals ("VLTs") at Aqueduct Racetrack in the Ozone Park neighborhood of Queens. In the future with the Proposed Project, the new VLTs would be installed in a renovated Grandstand, and would begin operating in 2010. However, the analyses in this attachment, which focus on the street system providing access to the project site and parking conditions in the area, examine conditions in 2011 when full demand for the VLTs would likely materialize. This study essentially updates a 2004 traffic study conducted for the installation of VLTs at the Aqueduct Racetrack. Existing 2009 conditions on the street system and parking facilities serving the racetrack are described, as are future conditions in the year 2011 without the Proposed Project (the "No Build" condition), and the increase in travel demand resulting from the addition of 4,500 VLTs. Conditions in the 2011 future with the Proposed Project (the "Build" condition) are then assessed. Travel demand data collected at Yonkers Raceway where over 5,300 VLTs have been installed since 2004 are utilized, along with traffic count and parking data collected in the vicinity of the project site in 2009.

With implementation of the Proposed Project, Aqueduct Racetrack would continue to hold thoroughbred races from late October to May, and would remain open all year-round for the VLTs. The operating hours for the VLTs would be 10AM to 2AM, 365 days of the year. This attachment analyzes the new transportation demands by vehicle to the racetrack. The attachment focuses on transit and pedestrian conditions. There are four locations that are used to enter the Aqueduct Racetrack complex. The two main entrances are at the intersection of Rockaway Boulevard and 108th Street to the north and on North Conduit Avenue to the south. Two secondary entrances are located at Pitkin Avenue to the west and Racetrack Road, which extends southward over the Belt Parkway to Lefferts Boulevard. Figure 1 shows the site location and the surrounding roadway system. On-site, it is expected that the main gaming room entry would be on the west side of the Grandstand and on-site circulation would be modified accordingly to accommodate the new entry. In addition, a potential new garage may be constructed, if warranted, by the future operator. Off-site improvements would be made to three of the intersections in the area as part of the Proposed Project. Two of these intersection improvements would be located along Rockaway Boulevard at the Aqueduct Entrance/108th Street and at 113th Street. The other intersection that would be improved is located at Cross Bay Boulevard and Pitkin Avenue.

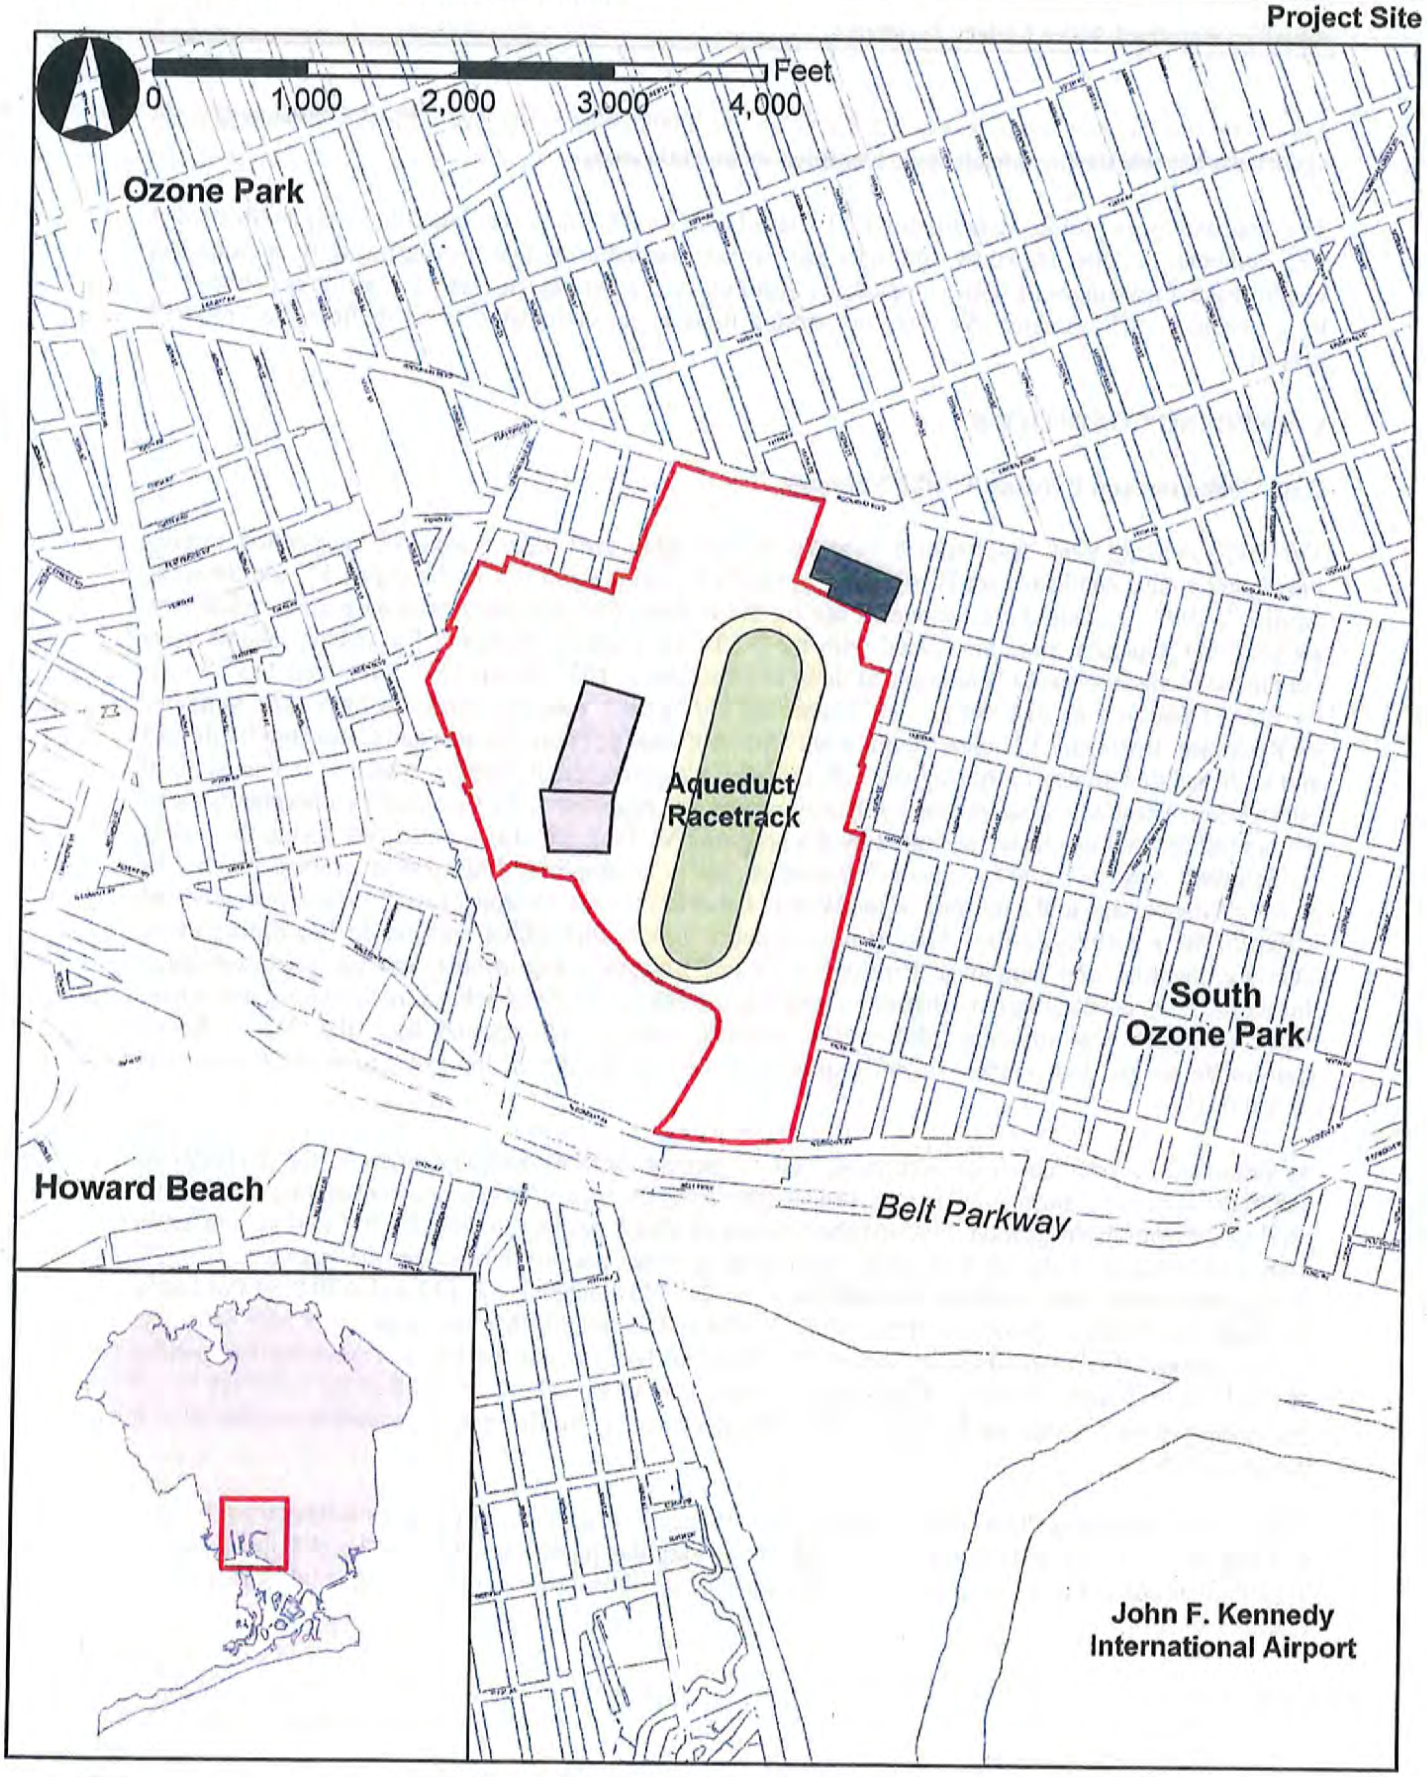

B. OVERVIEW OF 2004 AND 2009 STUDIES

As noted above, this study essentially updates a 2004 traffic study conducted for the installation of VLTs at the Aqueduct Racetrack. The findings of this traffic and parking study are similar to those of the 2004 assessment. However, the 2004 study was based on anticipated VLT traffic patterns while this 2009 study uses patterns derived from surveys of actual VLT usage at Yonkers Raceway. Based on these data, the peak weekday was found to be Friday and the peak weekend day was found to be Saturday. The updated patterns show heavier usage on these two days and lighter demand on the other five days of the week. In addition, the data show that VLT usage peaks at about 10 PM and that the heaviest arrival period for VLT travel demand is between 8:30 and 9:30 PM. Therefore, unlike in the 2004 study, this new peak hour was analyzed for both Friday and Saturday.

The 2004 study incorporated traffic improvement measures at a total of four intersections in order to accommodate project-generated demand. As discussed in more detail in Section E, below, the same types of improvements as incorporated in the 2004 study were found to remain effective based on 2009 data at three of the same four locations. The traffic improvements incorporated at one location in the 2004 study

Aqueduct Racetrack Video Lottery Terminals

Figure 1
Project Site

were found to be no longer warranted based on the 2009 assessment. As with the 2004 study, no significant adverse traffic impacts were identified in the 2009 study.

The estimated peak parking demand for VLT usage based on 2009 data was found to be higher than what was estimated in 2004. However, the more current forecast indicates that parking capacity at Aqueduct would reach a maximum of only 80 percent utilization, even assuming that no new garage is constructed by a potential VLT operator. As such, no parking impacts are anticipated to result from the Proposed Project.

C. EXISTING CONDITIONS

Data Collection and Existing Traffic Volumes

The 2009 existing peak hour traffic volumes in the study area were based on intersection turning movement counts conducted on Wednesday April 1st, Thursday April 2nd, Friday April 3rd, and Saturday April 4th, 2009. Counts were conducted during the midday, PM and early evening periods when new arriving and departing trips associated with the VLTs are expected to peak. The manual counts were conducted along Rockaway Boulevard at three intersections -- 108th Street, 111th Street and 113th Street. (A Home Depot is located between 111th Street and 113th Street, with an entrance at both of those streets on Rockaway Boulevard.) Manual counts were also conducted at Pitkin Avenue and Cross Bay Boulevard and at the south entrance to the Aqueduct Racetrack on North Conduit Avenue, which is an unsignalized intersection. These intersections were selected as they are expected to be traversed by concentrations of the new traffic that would be generated by the proposed VLTs. It should be noted that during the counts on Saturday April 4th, 2009, Aqueduct Racetrack had a substantially higher than average number of Saturday visitors due to the running of the Wood Memorial, NYRA's premier race for three-year-olds and a step to the Kentucky Derby. Also of note is that a flea market which operates in late Spring every Tuesday, Saturday and Sunday in Parking Lot A (off Rockaway Boulevard), was not yet in operation during the 2009 count program. Therefore, traffic generated by the flea market is not reflected in the base traffic networks. Use of these 2009 traffic networks without the demand from the flea market is appropriate as the flea market is not expected to operate during racing days once VLT operation commences.

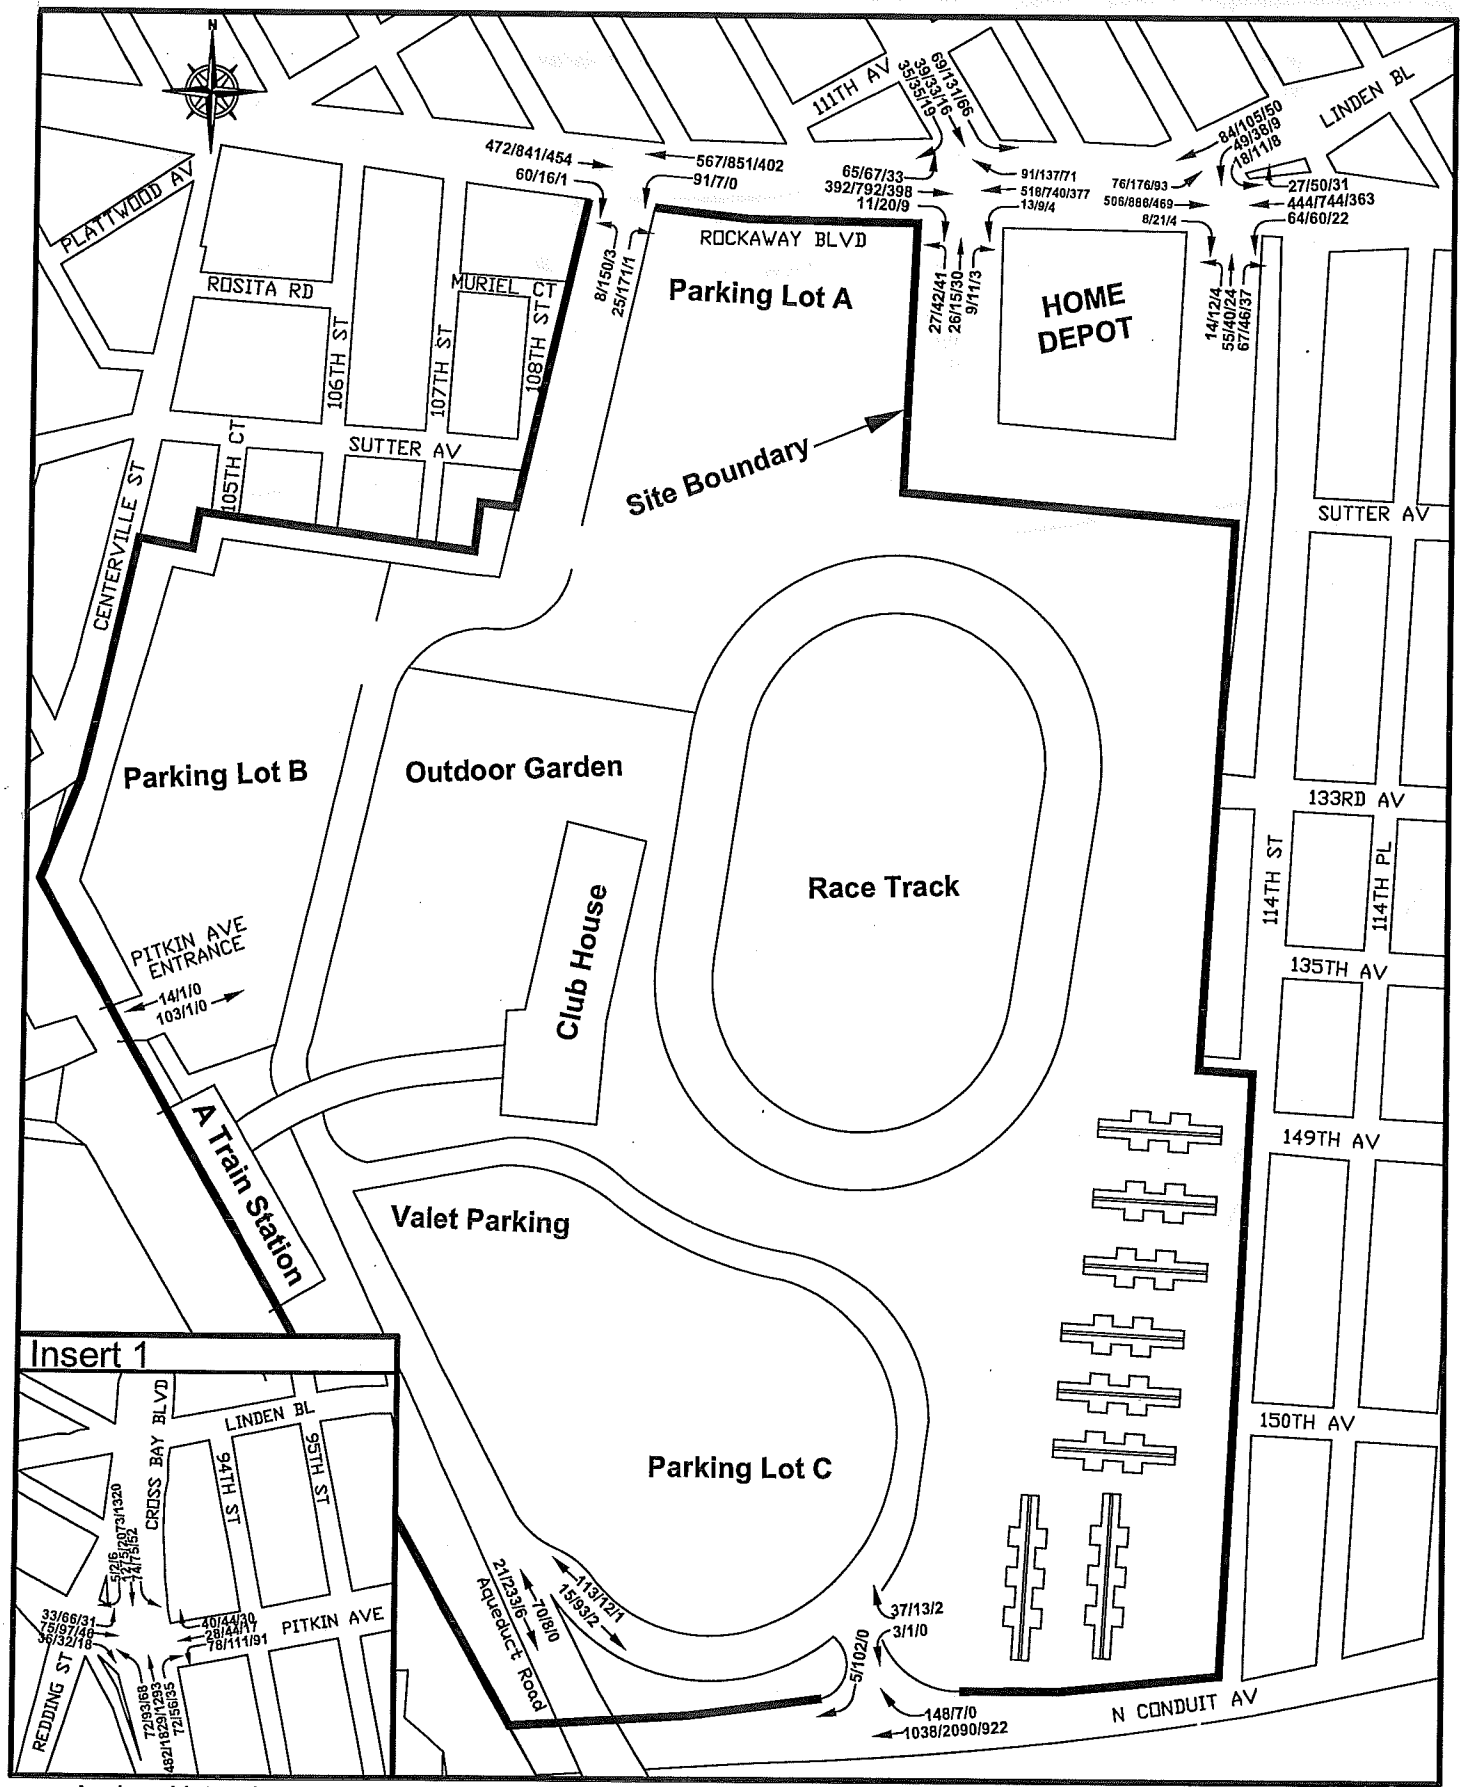

As discussed in more detail in Section D, below, gaming demand typically peaks in the evenings on Saturday. However, during the racing season (the analysis season) there are overlapping traffic and parking demands from gaming uses and the arriving racetrack patrons in the 12-1 PM period, and again from 5:30 PM to 6:30 PM on Saturdays, when most racetrack patrons depart after the last race. As such, this updated traffic study analyzes six peak hours -- 12-1 PM (midday), 5-6 PM and 8:30-9:30 PM (early evening) on a Friday, and the 12-1 PM, 5:30-6:30 PM and 8:30-9:30 PM three peak hours on a Saturday. As also discussed in more detail in Section D, below, Friday is by far the heaviest weekday for gaming demand. There is little variation in racetrack demand among weekdays, except that the racetrack is not typically open on Mondays or Tuesdays. Therefore, the weekday traffic analysis examines conditions on a typical Friday.

Figure 2 shows existing 2009 traffic volumes at study area intersections for the three weekday peak hours and Figure 3 shows the existing volumes for the three Saturday peak hours. Figures 2 and 3 also show the vehicles that entered and exited at Racetrack Road, the employee/trainer entrance via 114th Street and at Pitkin Avenue.

Not to Scale

Data on physical and operational characteristics of the street network, including signal timings, were obtained from field surveys conducted during April 2009. Official signal timings have been obtained from NYCDOT and are utilized in this analysis.

Street Network

The study area for the traffic analysis concentrates on the principal access/egress corridors along Rockaway Boulevard and North Conduit Avenue. In the study area, Rockaway Boulevard extends from Woodhaven Boulevard to the Van Wyck Expressway, while North Conduit Avenue extends from Lefferts Boulevard to Cross Bay Boulevard. Both racetrack entrances on North Conduit Avenue and at Racetrack Road provide access to the Belt (Shore) Parkway. The study area analyzed herein includes the local street system immediately to the north and west of Aqueduct. The study area is primarily residential, with neighborhood commercial and institutional uses fronting the major roadways. The regional highway/arterial system serving this area includes the Van Wyck Expressway to the east, the Belt Parkway to the south and Cross Bay Boulevard via north/south Conduit Avenue to the west. Cross Bay Boulevard becomes Woodhaven Boulevard north of Rockaway Boulevard. The Van Wyck Expressway (I-678), is a six- to eight-lane north-south freeway with major interchanges to the Whitestone Expressway, the Grand Central Parkway, the Long Island Expressway and the Belt Parkway. Woodhaven Boulevard/Cross Bay Boulevard, an arterial with six-lanes plus service roads, is a north-south connector with access to Queens Boulevard, the Jackie Robinson Parkway and Atlantic Avenue. The Belt Parkway has six travel lanes and traverses east-west along the south shore of Brooklyn and Queens. Interchanges with Cross Bay Boulevard and Lefferts Boulevard provide access to the project site.

The street network within the study area consists of both local streets and arterials. Rockaway Boulevard, the principal two-way feeder roadway for the north side of Aqueduct, extends from Nassau County to the east to Atlantic Avenue to the west and has interchanges with both the Van Wyck Expressway and the Belt Parkway east of the site. In the study area, Rockaway Boulevard has two travel lanes in each direction plus dedicated left-turn lanes at each key intersection. All major intersections along Rockaway Boulevard are signalized. There is parking along both curbs, with meters located on portions of the north side of the street. The Q7 and Q37 bus routes traverse Rockaway Boulevard adjacent to Aqueduct. Vehicles traveling south on Woodhaven Boulevard and Liberty Avenue, and vehicles traveling south on the Van-Wyck Expressway typically use the Rockaway Boulevard entrance for access into the project site.

North Conduit Avenue operates one-way westbound and includes four lanes with no parking. It acts as the service road for the Belt Parkway. Vehicles traveling west on the Belt Parkway or north on the Van-Wyck Expressway typically use the North Conduit Avenue entrance to access the project site. The B15 bus route traverses North (and South) Conduit Avenue.

The racetrack's Pitkin Avenue entrance is mainly used by vehicles traveling on Cross Bay Boulevard/Woodhaven Boulevard and eastbound on the Belt Parkway. The Q11 bus route runs along Pitkin Avenue just west of Aqueduct. The Racetrack Road entrance was originally built as an access road across the Belt Parkway to additional parking lots on Lefferts Boulevard. Racetrack Road has access to the Belt Parkway via Lefferts Boulevard.

Racetrack traffic is distributed among all four access points, and therefore is disbursed among several different roadways. Based on 2009 field survey data, the Rockaway Boulevard entrance is the most heavily utilized with about one-third (35 percent) of racetrack demand. These trips are generally divided almost equally between vehicles en route to and from the east and to and from the west. Approximately

30 percent of vehicle trips were found to use North Conduit Avenue, 20 percent use Racetrack Road and 15 percent use Pitkin Avenue.

Capacity Analysis Methodology

Capacity analyses for the study area were conducted using the methodology from the *Highway Capacity Manual 2000* (HCM), and Version 5.3 of the HCS+ software. Different procedures are used for signalized and unsignalized intersections due to the differences in driver interactions, and therefore capacity, at the two types of intersections.

Information required for signalized intersections includes: volumes on each approach, signal timings, peak hour factors (PHFs), percentage of heavy vehicles, basic roadway geometrics including number and width of lanes, curbside parking usage, and various other physical and operational characteristics. The HCM methodology provides the volume-to-capacity (v/c) ratio, average vehicle delay and level of service (LOS) for each signalized intersection approach.

The v/c ratio represents the ratio of traffic volume on an approach to its traffic carrying capacity. At a v/c ratio of 1.0 the intersection lane group operates at or over capacity, generally with severe traffic flow congestion, stop-and-start conditions and extensive vehicle queuing and delay. A value of 0.5 indicates that half of the available capacity is being used and traffic flows are generally acceptable. The HCM methodology also expresses quality of flow at signalized intersections in terms of level of service, based on the average delay encountered by vehicles along each intersection approach. As shown in Table 1, levels of service range from A, with very low delay (10 seconds or less per vehicle), to F, representing unacceptably long delays (more than 80 seconds per vehicle). Levels of service A, B, and C generally represent favorable to fair levels of traffic flow. The influence of congestion becomes noticeable at LOS D, LOS E is considered to be the limit of acceptable delay, and LOS F is unacceptable to most drivers. In this traffic study, a signalized lane group operating at LOS E or F or a v/c ratio of 0.90 or greater indicates congested conditions.

Unsignalized intersections are analyzed based on the use of "gaps" in the major traffic stream by vehicles crossing through or turning into that stream. It is generally assumed that traffic on a major street (i.e., the flow with the right of way) is not affected by minor street flows, but left turns from the major street are affected by oncoming major street traffic flow. The traffic flows on minor streets are affected by all conflicting movements. Key data required to analyze the unsignalized intersections include geometric factors, any nearby signalized intersections, and volumes, and this method expresses quality of flow in terms v/c ratio, delay and level of service for each approach. Table 1 shows the LOS/delay relationship for signalized and unsignalized intersections using the HCM methodology.

2009 Existing Traffic Conditions

Table 2 shows the results of the updated capacity analyses for the five analyzed intersections within the study area, with corresponding v/c ratios, delays and levels of service for each movement in each analyzed peak hour. The results include both weekday (Friday) and Saturday conditions for each analysis period. The table also highlights those movements with LOS E or F or a v/c ratio pf 0.90 or greater. Both of these levels indicate potential congestion. As shown in Table 2, two signalized intersections within the study area presently experience congestion in at least one peak period on Friday, while four signalized intersections are congested in one or more Saturday peak hours. These are discussed in more detail below.

Table 1

Intersection Levels of Service Criteria

	Average Delay Per Vehicle (seconds)	
Level of Service	Signalized Intersection	Unsignalized Intersection
A	10.0 or less	10.0 or less
B	10.1 to 20.0	10.1 to 15.0
C	20.1 to 35.0	15.1 to 25.0
D	35.1 to 55.0	25.1 to 35.0
E	55.1 to 80.0	35.1 to 50.0
F	greater than 80.0	greater than 50.0
Source: *2000 Highway Capacity Manual*		

Table 2 shows that on Fridays, the southbound movement on 111th Street at Rockaway Boulevard is congested in the PM peak hour with LOS E conditions. At the Cross Bay Boulevard/Pitkin Avenue intersection, the westbound approach is congested in the PM with LOS F conditions, as is the southbound through/right movement which also operates at LOS F. The northbound through/right movement is congested in the PM with a V/C ratio of 0.96 (LOS D). There are no congested movements at any analyzed intersection on Friday in either the midday or evening peak hours.

Table 2 shows that on Saturdays, the westbound left-turn on Rockaway Boulevard at 108th Street is congested in the midday peak hour with LOS F at this entry to the project site. At Rockaway Boulevard/111th Street, the southbound approach operates at LOS E in both the midday and PM peak hours, while the southbound right-turn at Rockaway Boulevard/Linden Place operates at LOS F in the midday. At the intersection of Pitkin Street and Cross Bay Boulevard, the westbound Pitkin Avenue movement operates at LOS F in the midday and LOS E in the PM, while the northbound through-right movement operates with a v/c ratio of 0.90 (LOS D) in the midday. As shown in Table 2, there are no congested movements in the Saturday evening peak hour.

Parking

Table 3 shows attendance data for the Aqueduct Racetrack for the years 1970 through 2006. As shown in the table, in 1970 an average of over 30,000 patrons visited the track on a typical race day. In the 1970s, Linden Boulevard was closed between Rockaway Boulevard and 108th Street and the amount of parking was expanded to help accommodate this level of demand. However, as shown in Table 3, attendance has steadily declined in the 36-year period following 1970. In 2006, an average of 2,867 patrons visited the track on a typical race day, less than 10 percent of the 1970 attendance level. This low level of attendance remains under current 2009 conditions.

There are currently three parking lots at the Aqueduct Racetrack -- Lot A located next to Rockaway Boulevard, Lot B located adjacent to the Pitkin Avenue entrance, and Lot C located near North Conduit Avenue and Racetrack Road. Based on existing surveys provided by NYRA, Parking Lot A has an area of

997,000 square feet. Parking Lot B has an area of 887,000 square feet while Lot C has an area of 1,137,000 square feet. Parking Lot C is a city owned lot leased to the Port Authority of New York and New Jersey. While the lots are currently used by some racetrack patrons, the analysis assumes that Lots A and B with a total area of 1,884,000 are available for parking at the project site. It is estimated that the total number of general parking spaces that would be possible in the two parking areas combined would total approximately 6,280. According to the Zoning Resolution, Aqueduct Racetrack is in a C8-1 zoning district, which requires one parking space for every eight persons of rated capacity. Therefore, 6,280 parking spaces are sufficient for a total capacity of approximately 50,000 people. All parking at Aqueduct Racetrack is currently free, and the NYRA operates an internal bus shuttle between the parking lots and the Grandstand/Clubhouse entrances.

Data on the number of vehicles entering and exiting the parking facilities at the racetrack were collected at the four entrances from 11 AM to 9:30 PM on Friday April 3rd and Saturday April 4th, 2009. Table 4 illustrates the estimated hourly parking accumulation on Friday and Saturday (with the Saturday data reflecting demand during the Wood Memorial). On both days the first race commenced at about 1PM. As shown in the table, the greatest parking demand occurred on Saturday between 3 PM and 4 PM when an estimated 2,731 cars were present at the track.

D. FUTURE CONDITIONS WITHOUT THE PROPOSED PROJECT (NO BUILD)

Traffic

Transportation conditions in the future without the proposed project (the No Build condition) were estimated by assuming a one percent per year background growth rate to account for increased travel demand from small development projects in the area, increased car ownership and other long-term trends. No large developments to be completed and operational during the 2009 through 2011 period were identified in the immediate area of the project site.

Figures 4 and 5 show the expected future No Build peak hour traffic volumes within the study area in each of the analyzed peak hours. Table 5 shows the results of the capacity analyses for the No Build Condition and compares these results with exiting 2009 conditions. As shown in Table 5, no movements at any analyzed intersection will become newly congested in any peak hour in the No Build condition, however, increased demand will worsen existing congestion at intersections in the study area.

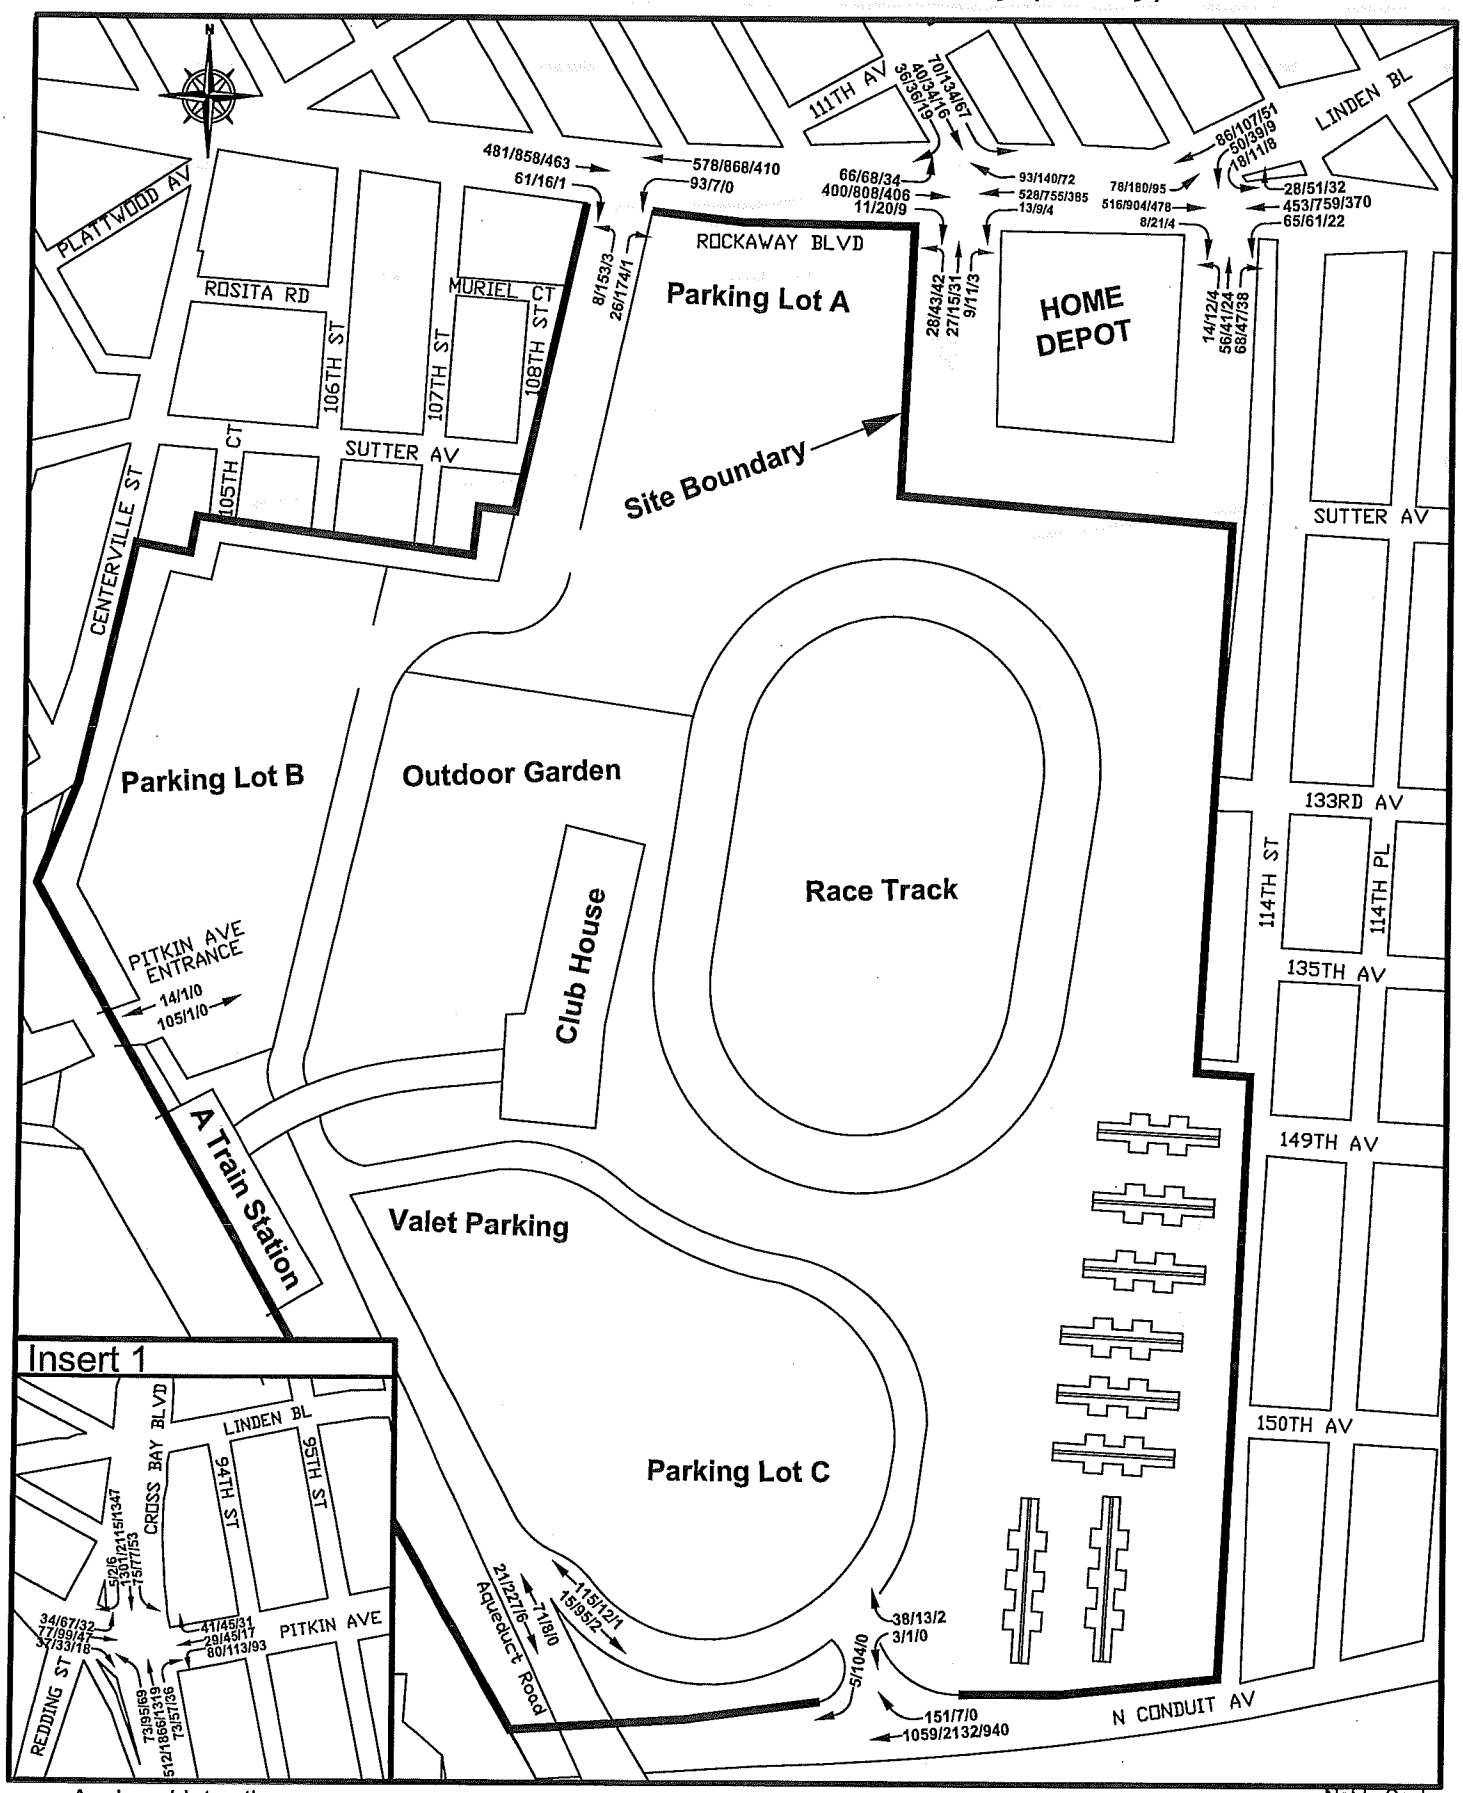

Parking

Under 2011 No Build Conditions, it is expected that there would be no measurable increase in parking demand at the project site. Typical weekday demand would be very low, and peak demand would occur on Saturday during signature pre-Kentucky Derby races, such as the Wood Memorial documented in the above analysis.

E. PROBABLE IMPACTS OF THE PROPOSED PROJECT

Beginning in 2010, the New York State Lottery proposes to install 4,500 new video lottery terminals within the Aqueduct Racetrack Grandstand. Full utilization of these VLTs is expected to occur by 2011 (the traffic and parking analysis year). In the future with the Proposed Project, it is expected that a new entrance to the VLT floors would be created on the west side of the building (where the existing garden is located) to handle both pedestrian and vehicle drop-offs for valet parking. A new parking garage would also likely be installed in close proximity to this gaming entrance, along with other on-site circulation improvements. It is also expected that the Rockaway Boulevard entrance would be modified to remove the entrance booths, thereby forming a standard intersection at this entrance/exit. In addition, three intersections in the study area would be improved as part of the Proposed Project, and these traffic improvements are detailed below and are shown in Table 6. The three proposed improvements are essentially the same as those previously proposed in 2004 and coordinated with NYCDOT, while a fourth improvement proposed in 2004 at Rockaway Boulevard/111th Street was found to no longer be needed. All intersection improvements would be implemented by NYRA/NYS Lottery, or by the selected operator.

Rockaway Boulevard at Aqueduct Driveway/108th Street. At this location it is proposed to modify the intersection's signal plan to provide a new lagging westbound phase to facilitate the westbound left-turn movement into the project site. Table 6 shows the proposed signal timing plans for this intersection for the different weekday and weekend peak periods. In addition, it is proposed to formalize the racetrack exit driveway at this intersection to provide three northbound lanes with markings for left-turn, left-right, and right-turn lanes, each 11 feet in width. New left-turn signal heads would be added to the existing installation for the lagging westbound phase along with the intersection approach improvements on the project site.

Rockaway Boulevard at Linden Boulevard. It is proposed to modify the intersection's signalization to add an eastbound and westbound exclusive left-turn phase along with a concurrent southbound right-turn phase. Twelve seconds of signal time would be transferred to this new phase from the existing eastbound/westbound phase. Exclusive lanes already exist for both movements and no changes to the intersection's lane markings would be necessary. New left-turn and right-turn signal heads would be added to this intersection.

Cross Bay Boulevard at Pitkin Avenue. It is proposed to implement a no standing anytime regulation along the north curb of westbound Pitkin Avenue for approximately 100 feet approaching the intersection, and to re-stripe the approach to add an exclusive right-turn-only lane approaching Cross Bay Boulevard. As shown in Table 6, signal timing adjustments of up to three seconds are also proposed in the weekday PM and Saturday midday and evening peak periods.

Trip Generation

Table 7 shows the transportation planning assumptions used to estimate the new travel demand from the proposed addition of 4,500 video lottery terminals at Aqueduct Racetrack. It is expected that by 2011, a total of approximately 8.5 million patrons would visit the new VLT facility annually. The temporal and directional distribution patterns of VLT patrons incorporated in the demand forecast were developed from NYS Lottery data and field counts conducted at the existing VLT operation at Yonkers Raceway. Table 8 shows the typical daily pattern, while Table 9 shows the hourly accumulation pattern for on-site VLT users on a Friday and Saturday.

Charter Bus	35	35	persons/vehicle

NOTES:

(1) Based on data from Urban Systems , "Technical Memorandum: Recalculation of VLT Revenues at New York Race Tracks Based Upon Proposed Operating Assumptions". In addition, a 2% linked-trips factor is appplied to total daily persons trips to account for linked trips between racing and gaming patror

(2) Daily pattern based on 1st Quarter 2009 pattern at Yonkers Raceway.

(3) Traffic/Parking survey at Yonkers Raceway April 17th and April 18th 2009.

(4) PHA estimate based on counts at Aqueduct and Yonkers in April 2009, as well as secondary research. 3% charter bus is forecasted for this land use.

(5) Based on data collected at Aqueduct April 2009.

As shown in Table 8, Saturday would be the busiest day of the week with 22.7 percent of weekly demand, followed by Sunday and Friday, each with approximately 17.5 percent. VLT patronage would be lowest on Tuesdays with approximately 9.9 percent of weekly demand. As shown in Table 9, over the course of day, the heaviest utilization of VLTs would occur between 8PM and midnight, with about 30 percent of the daily demand on-site between 9 PM and 10 PM.

As shown in Table 7, the estimated daily person trips generated by the Proposed Project would total approximately 56,300 (in and out combined) on Fridays and 72,700 on Saturdays. As also noted in Table 7, a credit of two percent is assumed to account for linked trips associated with existing racetrack patrons who would also use the proposed VLTs, yielding a total net increment of approximately 8.3 million new VLT patrons annually.

Table 10 provides the estimated person trip and vehicle trip forecasts for the six analyzed peak hours. As shown in Table 10, as an example, there would be an increase of 1,024 vehicle trips in the Friday midday peak hour (702 in/322 out), 1,187 vehicle trips in the Saturday midday peak hour (929 in/258 out), and 2,654 vehicle trips in the Saturday evening peak hour (1,457 in/1,197 out) due to the new VLT operation. Subway trips during these peak hours would increase by 243 to 631, while local bus trips (not including trips by charter bus) would increase by 297 to 771 per hour, depending on the peak period.

Table 8
Daily Distribution of VLT Patrons

Day	Percent of Week
Monday	10.8%
Tuesday	9.9%
Wednesday	10.0%
Thursday	11.5%
Friday	17.6%
Saturday	22.7%
Sunday	17.5%
Total	100%

Source: NYS Lottery

Vehicular Traffic

The incremental traffic demands in the six analyzed peak hours were assigned to the surrounding streets and the various entrances into Aqueduct based on existing travel patterns at the project site. Figure 6 shows the assignment patterns assumed for each vehicle entrance. The highest number of vehicles (a total of 35 percent) are expected to utilize the Rockaway Boulevard/108th Street entrance. Approximately 30 percent would utilize the entrance on North Conduit Avenue, 20 percent would utilize the Racetrack Road entrance and 15 percent would utilize the Pitkin Avenue entrance. The project increment vehicle trips in each of the six analyzed peak hours are shown on Figures 7 (Friday) and Figure 8 (Saturday).

Not to Scale

The Build condition traffic volumes, which combine the No Build volumes with the project increment, are shown on Figures 9 and 10, for Friday and Saturday, respectively. Table 11 shows the resulting capacity analysis comparison between the No Build condition and the Build condition for reach analysis period.

The following impact criteria were used to identify significant adverse impacts: if levels of service deteriorate from LOS A, B or C in the No Build condition to marginally unacceptable mid-LOS D or unacceptable LOS E or F in the Build condition, then a significant traffic impact has occurred. For No Build LOS D, an increase of five or more seconds in a lane group in the Build condition should be considered significant if the Build delay exceeds mid-LOS D. For No Build LOS E, an increase in delay of four seconds should be considered significant. For No Build LOS F, three seconds of delay should be considered significant, however, if the No Build LOS F condition already has delays in excess of 120 seconds, an increase of 1.0 second in delay should be considered significant, unless the Proposed Project would generate fewer than five vehicles through that intersection in the peak hour (signalized intersections) or fewer than five passenger car equivalents (PCE) in the peak hour along the critical approach (unsignalized intersections). In addition, for unsignalized intersections, for the minor street approach to generate a significant impact, 90 PCEs must be identified in the Build condition in any peak hour.

As shown in Table 11, based on these impact criteria, the new traffic generated by the introduction of VLTs at Aqueduct Racetrack would not result in significant adverse traffic impacts at any signalized intersection analyzed for this study during any of the six peak hours. The unsignalized intersection of North Conduit Avenue and the Aqueduct entrance driveway would also not be impacted by project traffic in any peak hour.

Parking

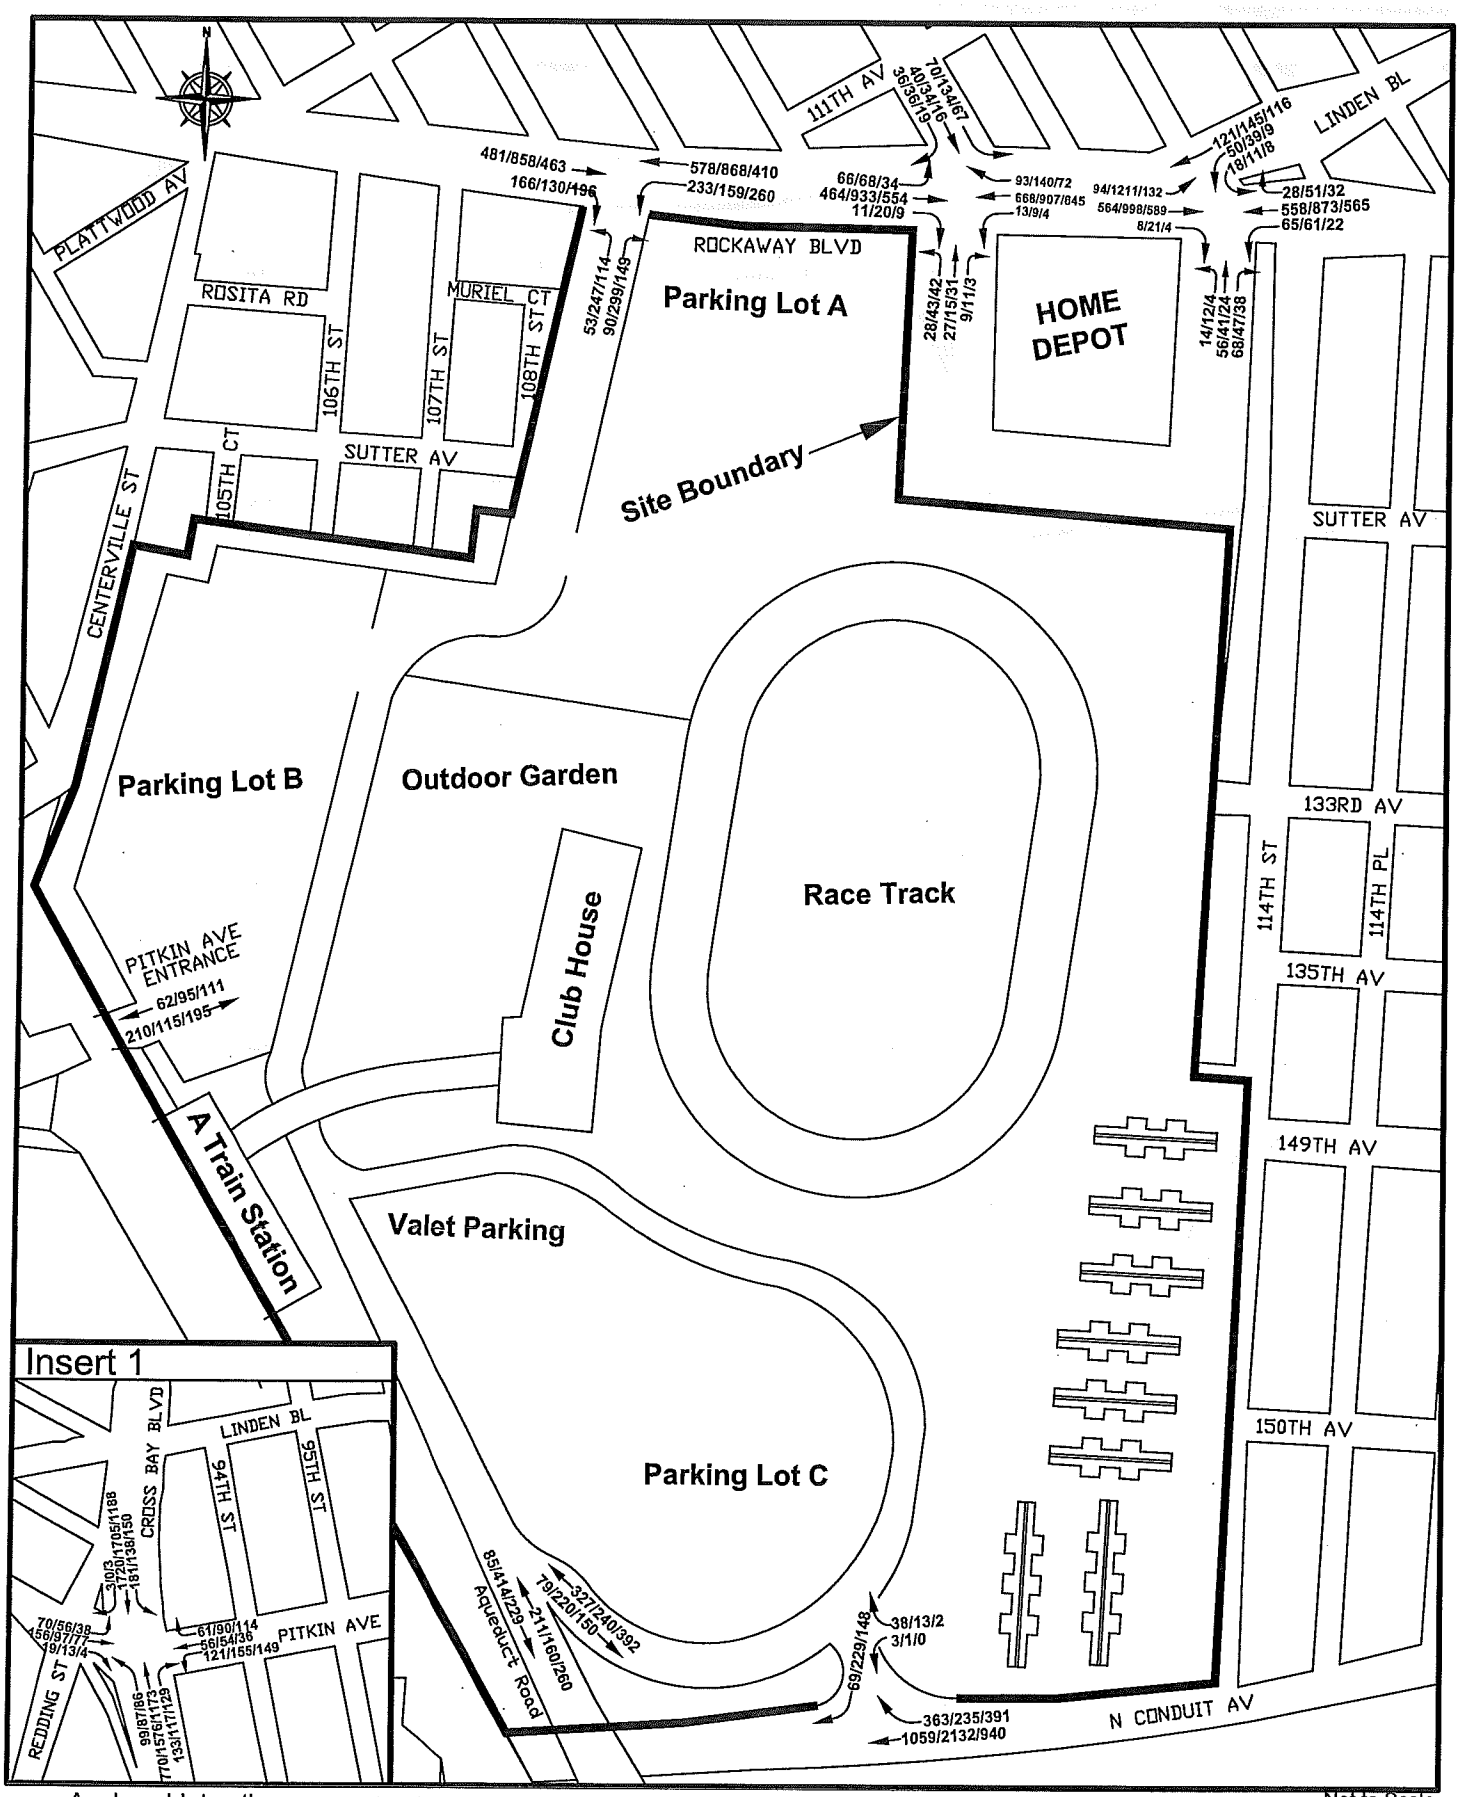

The proposed installation of 4,500 video lottery terminals at Aqueduct Racetrack would create its highest demand on Saturday evening. As noted previously, gaming operations occur between 10 AM and 2AM. As such, it is expected that parking demand from VLT patrons would commence earlier than typical racetrack demand (the first race is typically at 1 PM) and would peak in the evening substantially after the race day has ended. Table 12 shows the projected new Friday and Saturday parking demands. As shown in Table 12, new incremental demand from VLT operations would peak at about 4,112 spaces at 10 PM on Saturday. However, the overall peak parking demand at the project site would occur during afternoon periods when VLT and racetrack demand would overlap, and would total approximately 5,000 spaces between 3 PM and 4 PM on a peak racing Saturday (refer to Table 4 for peak racetrack parking demand). No other period would reach this level of demand. As noted earlier, Aqueduct racetrack presently has approximately 6,280 parking spaces in Lots A and B. (Lot C is not included in the analysis although field observations indicate that some racing fans also park in that lot.) Based on this capacity, future parking demand at Aqueduct Racetrack with the VLT installation could be fully accommodated by the present capacity available in Lots A and B, with utilization peaking at about 80 percent of capacity between 3 PM and 4 PM on a peak Saturday.

As noted previously, it is possible that the operator selected for the proposed VLT installation may decide to construct a parking garage of undetermined size to provide increased capacity in closer proximity to the entrance to the gaming facility. While the construction of such a garage might require the displacement of some existing parking spaces, total on-site parking capacity would increase, thereby reducing the overall peak utilization rate from the 80 percent noted above.

TABLE 12

Estimated Parking Accumulation For Proposed VLT Operation

Time	Friday			Saturday		
	In	Out	Accumulation	In	Out	Accumulation
7-8	68	38	30	36	24	12
8-9	70	41	59	53	37	28
9-10	175	53	181	127	33	122
10-11	418	173	426	598	137	583
11-12	502	243	685	568	333	818
12-01	690	310	1,065	914	243	1,489
01-02	604	416	1,253	810	493	1,806
02-03	620	453	1,420	855	567	2,094
03-04	650	539	1,531	916	741	2,269
04-05	657	627	1,561	899	840	2,328
05-06	745	609	1,697	1,036	848	2,516
06-07	897	564	2,030	1,334	888	2,962
07-08	1,038	630	2,438	1,228	811	3,379
08-09	1,285	719	3,004	1,428	1,168	3,639
09-10	1,066	920	3,150	1,506	1,033	4,112
10-11	368	620	2,898	405	840	3,677
11-12	274	704	2,468	383	936	3,124
12-11	166	643	1,991	245	790	2,579
1-2	64	1,040	1,015	80	1,284	1,375
2-3	55	1,070	0	18	1,393	0

At gaming facilities, a portion of the parking demand is typically accommodated by valet parking, which would be offered by the facility operator. Data collected at Yonkers raceway indicate that approximately 16 percent of VLT patrons choose valet parking on Friday and 19 percent on Saturday. While it is not known precisely what the valet component would be at the proposed Aqueduct facility, the more efficient utilization of parking space associated with valet parking would further increase the overall parking capacity at the site, and therefore no parking impacts are expected.

F. CONCLUSION

The introduction of VLT operation at Aqueduct Racetrack would result in increased transportation demand in the study area. However, with transportation improvements both on-site and off-site, no significant adverse traffic or parking impacts are expected.

It is important to note that the traffic impact analysis presented in this attachment should be considered very conservative, especially with respect to Saturdays when the forecasted conditions (VLT demand concurrent with a premiere race) would occur only two or three times per year. Aqueduct is open for racing for just under six months of the year. As shown in Table 3, when accounting for the fact that there is no racing on Mondays and Tuesdays, as well as during selected holidays, there is no racing at Aqueduct for two-thirds of the days each year. Further, as noted above, conditions assessed for the key traffic period on Saturday -- the 5:30 to 6:30 PM period – would occur approximately twice per year (during the Gotham Stakes and the Wood Memorial races) and potentially during a small number of other undefined special events. Therefore, as an example, the approximately 5,000 parking spaces of total peak demand on Saturday would occur very infrequently. Similarly, the proposed traffic improvements implemented to accommodate these rare peak periods would result in very good levels of service under more typical conditions, even when there is racing at Aqueduct. As such, no significant adverse traffic or parking impacts are expected.

A. INTRODUCTION

This attachment describes the transit and pedestrian characteristics and potential impacts associated with the Proposed Project, which is the addition of 4,500 video lottery terminals ("VLTs") at Aqueduct Racetrack in Ozone Park, Queens. In the future with the Proposed Project, the new VLTs will be installed in a renovated Grandstand, and would be in full operation by 2011. The analyses in this attachment focus on the subway and local bus modes operated by MTA New York City Transit ("NYC Transit" or "NYCT") and MTA Bus, as well as pedestrian trips. Existing 2009 conditions at transit and pedestrian facilities serving the racetrack are described, as are future conditions in the year 2011 without the Proposed Project (the "No Build" condition), and the increase in travel demand resulting from the addition of 4,500 VLTs. Conditions in the 2011 future with the Proposed Project (the "Build" condition) are then assessed.

Based on patron demand data from the existing video lottery terminals at Yonkers Raceway and the schedule for races at Aqueduct Raceway, the peak periods of travel demand at Aqueduct with the proposed VLT installation are expected to be the 12-1 PM (midday), 5:00-6:00 PM and 8:30-9:30 PM early evening peak hours on a Friday, and 12-1 PM, 5:30-6:30 PM and 8:30-9:30 PM on a Saturday. Based on the travel demand forecast shown in Table 9, "Traffic and Parking," it is estimated that the Proposed Project would generate approximately 243 to 486 subway trips during these periods on a Friday, and from 281 to 631 subway trips during these periods on a Saturday. Peak hour trips by local bus would range from 297 to 594 on a Friday, and from 344 to 771 on a Saturday, while pedestrian (walk-only) trips would range from 54 to 108 on a Friday, and from 62 to 140 on a Saturday.

B. EXISTING CONDITIONS

Data Collection

Data on existing transit and pedestrian demand at Aqueduct Raceway were collected on two weekdays (Thursday and Friday) and one Saturday in early April 2009. These data included subway trips at both subway stations serving the project site (the Aqueduct Racetrack and North Conduit/Aqueduct subway stations), and pedestrians entering and exiting the project site at the Pitkin Avenue entrance, and the two entrances on Rockaway Boulevard.

Subway Service

As shown in Figure 1, two NYC Transit subway stations provide access to Aqueduct Raceway – the Aqueduct Racetrack station and the Aqueduct-North Conduit Avenue station. Service at these stations is provided by A-trains operating on the IND Rockaway Line between Far Rockaway, Queens and 207th Street in Manhattan. The Aqueduct Racetrack station consists of a single side platform adjacent to the Manhattan-bound track with direct access to the Grandstand. As this station is only open from 11 AM to 7 PM on race days, and as only Manhattan-bound trains serve this station, all demand consists of trips either coming from the south at the beginning of the race card or exiting the racetrack en route to northern Queens, Brooklyn and Manhattan at the end of the day. The Aqueduct-North Conduit Avenue station consists of two side platforms, one each for Manhattan-bound and Queens-bound A-trains. On race days, a free courtesy bus service is provided by NYRA to shuttle subway passengers between this station and the Grandstand.

Table 1 shows the average weekday and Saturday entering turnstile counts at these two stations for the years 2005 through 2007, as well as the 2007 ranking of each station based on average weekday ridership relative to all 423 stations system-wide. As shown in Table 1, average demand at both of these two stations is very low relative to the other stations in the system. The Aqueduct Racetrack station ranks 422nd in ridership out of the 423 stations in the system, with an average of 58 passengers per day on weekdays and 167 on Saturdays. The Aqueduct-North Conduit Avenue station ranks 416th in ridership with an average of 895 passengers per day on weekdays and 430 on Saturdays. Overall, weekday demand increased by approximately 3.1 percent and Saturday demand by four percent from 2005 to 2007 at these two subway stations. Average weekday demand at the Aqueduct Racetrack station decreased by approximately 4.9 percent while average Saturday demand decreased by 5.1 percent. By contrast, weekday demand at the Aqueduct-North Conduit Avenue station increased during this same period by 3.7 percent on weekdays and eight percent on Saturdays.

Data from field surveys conducted in 2003 indicate that the percentage of racetrack patrons using the subway en route to Aqueduct is approximately 10 percent on weekdays and 12 percent on Saturdays. More recent data from surveys conducted in April 2009 indicate that the subway mode currently accounts for nine percent of trips en route to Aqueduct on both weekdays Saturdays.

Table 1
Average Weekday and Saturday Entering Turnstile Counts

Subway Station	2007 Rank	2005	2006	2007	Percent Change 2005—2007
Weekday					
Aqueduct Racetrack (A) Station	422	61	73	58	(4.9%)
Aqueduct - North Conduit Avenue (A) Station	416	863	909	895	3.7%
Totals		924	982	953	3.1%
Saturday					
Aqueduct Racetrack (A) Station	422	176	217	167	(5.1%)
Aqueduct - North Conduit Avenue (A) Station	416	398	438	430	8.0%
Totals		574	655	597	4.0%

Ranking out of 423 subway stations system-wide by 2007 average weekday ridership.
Source: NYCT 2007 turnstile registration data.

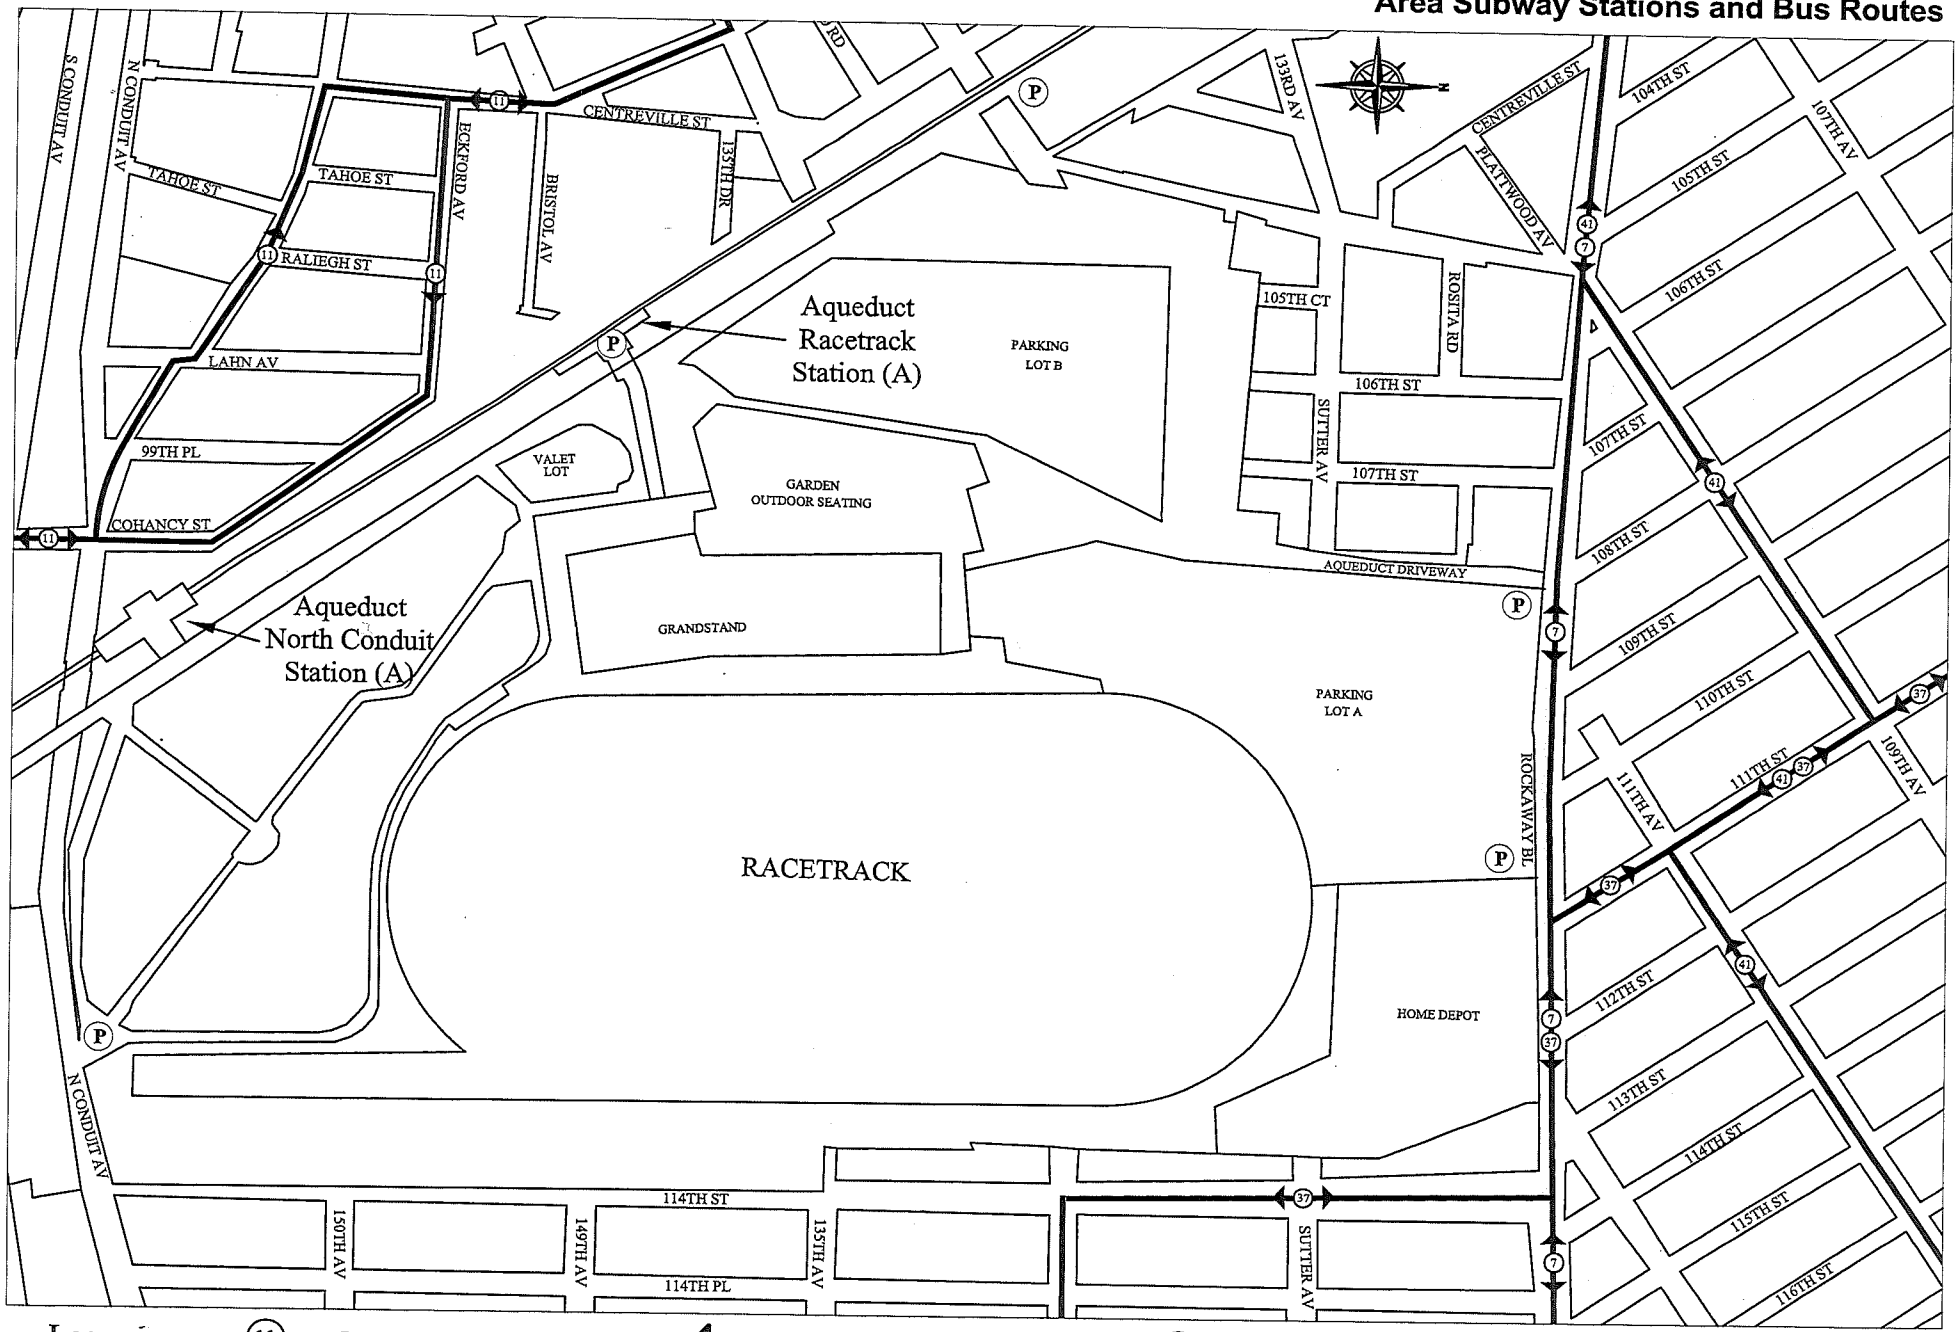

Bus Service

As shown in Figure 1, a total of five local bus routes operate within the vicinity of the project site – the Q7, Q11, Q37 and Q41 operated by MTA Bus, and the B15 operated by NYC Transit. As the B15 operates along North Conduit Avenue (westbound) and Nassau Expressway (eastbound) and does not provide convenient access to the racetrack, the majority of project-generated bus trips are expected to utilize the Q7, Q11, Q37 and Q41. The assessment of local bus service at the project site therefore focuses on these four routes, each of which is described below.

Aqueduct Racetrack Video Lottery Terminals

Figure 1

Area Subway Stations and Bus Routes

Q7 (Rockaway Boulevard/Pitkin Avenue)

The Q7 provides daily service in Queens and Brooklyn between 148th Street/South Cargo Road at JFK Airport and a western terminus at the Euclid Avenue subway station in East New York. Additional service operates between the Rockaway Boulevard subway station in Ozone Park and Sutphin Boulevard/Rockaway Boulevard at Baisley Park. These services operate every five to 20 minutes on weekdays and every 20 minutes on Saturdays. As shown in Figure 1, in the vicinity of the project site this route operates along Rockaway Boulevard with stops adjacent to an entrance to the racetrack.

Q11 (Woodhaven Boulevard)

The Q11 provides daily service in Queens, between the Woodhaven Boulevard subway station in Elmhurst and either 164th Avenue/99th Street in Howard Beach or 164th Avenue/104th Street in Hamilton Beach. Service is provided every 30 minutes on each of the two routes. In the vicinity of the project site, Q11 buses operate along Pitkin Avenue, Eckford Avenue (southbound) and Albert Road (northbound).

Q37 (111 Street/135th Avenue)

The Q37 provides daily service in Queens every six to 20 minutes on weekdays and every 20 to 30 minutes on Saturdays between the Kew Gardens-Union Turnpike subway station in Kew Gardens and 131st Street/135th Avenue in South Ozone Park. In the vicinity of the project site, Q37 buses operate along Rockaway Boulevard with a stop at 111th Street.

Q41 (127th Street/111th Avenue)

The Q41 provides daily service in Queens every nine to 20 minutes on weekdays and every 15 to 24 minutes on Saturdays between 164th Avenue/Cross Bay Boulevard in Lindenwood and the 165th Street Bus Terminal in Jamaica. In the vicinity of the project site, Q41 buses operate along Rockaway Boulevard, 109th and 111th Avenues and 111th Street. The nearest stop to the project site is located at the intersection of 111th Street and 111th Avenue one block north of the racetrack's main entrance.

In addition to these transit services, the New York Racing Association provides free courtesy buses to shuttle racetrack patrons between the Grandstand and outlying parking and subway facilities. Courtesy buses serve Parking Lot A at 111th Street and Rockaway Boulevard, the facility's Racetrack road pedestrian entrance on the south side of the project site, and the Aqueduct-North Conduit Avenue subway station.

Table 2 presents a summary of the approximate number of buses serving the project site in each peak hour. As shown in Table 2, on weekdays a total of approximately 32 buses (all routes, all directions) stop in proximity to Aqueduct Racetrack in the midday peak hour, 56 in the PM and 36 in the early evening peak hour. On Saturdays, the number of buses total approximately 34 in each of the midday and PM peak hours, and 26 in the early evening peak hour.

Table 2
Buses Per Hour Serving the Aqueduct Racetrack

Notes:
(1) Services to Euclid Avenue and Rockaway Blvd subway stations combined.
(2) Services to Howard Beach and Hamilton Beach combined.

Pedestrians

Existing pedestrian demand in the vicinity of the project site is generally very low. The greatest demand is typically found on sidewalks along Rockaway Boulevard and is associated with the bus services operating along this street.

As shown in Figure 1, pedestrian entrances to the project site are located on Rockaway Boulevard at 111th Street and at 108th Street/Aqueduct Driveway, at Pitkin Avenue, and on North Conduit Avenue. In addition, pedestrians en route to and from the two subway stations serving the racetrack enter and exit the project site at an entrance adjacent to the Aqueduct Racetrack station and at an entrance adjacent to the Aqueduct-North Conduit station. Table 3 shows the numbers of pedestrians entering and exiting the project site at each of these entrances during the midday, PM and early evening peak hours on a weekday (Friday) and a Saturday. As shown in Table 3, the highest volumes typically occur on Saturdays at the access points for the two subway stations serving the project site. A total of 186 pedestrians per hour were counted arriving at the racetrack via the Aqueduct-North Conduit Avenue subway station in the midday peak hour (at the start of racing), and 226 pedestrians per hour were counted exiting the racetrack at the Aqueduct Racetrack subway station in the Saturday PM peak hour (when races end for the day). No trips were counted exiting via the Aqueduct-North Conduit Avenue station or entering via the Aqueduct Racetrack station during these periods, reflecting the fact that the latter station provides the most convenient access to the Grandstand but is only served by trains in the Manhattan-bound direction. It should also be noted that many of the pedestrians en route to and from the Aqueduct-North Conduit Avenue subway station utilize the free courtesy buses provided by NYRA on race days and therefore do not walk between this station to the Grandstand.

The non-subway entrance with the highest volume of pedestrian demand is the entrance on Rockaway Boulevard at 111th Street at which 174 pedestrians (in and out combined) were counted in the Saturday midday peak hour and 104 in the Saturday PM peak hour. Much of the demand at this entrance is en route to and from bus stops located along Rockaway Boulevard. The next highest number of pedestrians

Notes:
Source: PHA April 2009 field counts.

were counted at the Pitkin Boulevard entrance with a total of 114 trips in the Saturday midday peak hour. On weekdays, by contrast, no subway or street entrance to the racetrack experienced more than 88 pedestrian trips in any peak hour during the 2009 count program.

C. FUTURE WITHOUT THE PROPOSED PROJECT (NO BUILD)

During the 2009 through 2011 period, no major changes to subway service and local bus routes in the vicinity of Aqueduct Racetrack are anticipated. Demand on the subway stations and local bus routes serving the project site is expected to increase as a result of general background growth (estimated at one percent per year) and new development in this area of Queens. As average daily attendance at Aqueduct Racetrack has been trending downward in recent years, pedestrian activity at the entrances to the racetrack is not expected to increase in the future without the Proposed Project.

D. FUTURE WITH THE PROPOSED PROJECT (BUILD)

In future with the Proposed Project, 4,500 video lottery terminals would be installed in a renovated Grandstand at the Aqueduct Racetrack by 2011. The installation of these new VLTs, would result in increased transit demand at the subway stations and bus routes serving the racetrack, as well as increased pedestrian activity at the entrances to the project site. Table 6 in "Traffic and Parking," presents the transportation planning factors utilized in the travel demand forecast for the proposed VLT installation at Aqueduct Racetrack, while Table 4, below, summarizes the total estimated peak hour transit and pedestrian trips generated by the Proposed Project in the weekday and Saturday peak hours. As shown in Table 4, it is estimated that the Proposed Project would generate approximately 243, 329 and 486 subway trips in the midday, PM and early evening peak hours on a Friday, respectively, and 281, 458 and 631 subway trips during these periods, respectively, on a Saturday. Trips by local bus would total 297, 402 and 594 during these periods, respectively, on a Friday, and 344, 560 and 771, respectively on a Saturday. (As discussed below, the Proposed Project would also generate trips by charter bus.) Pedestrian (walk-only) trips would total 54, 73 and 108 in the midday, PM and early evening peak hours, respectively, on a Friday, and 62, 102 and 140, respectively on a Saturday.

Table 4
Transit and Pedestrian Travel Demand Forecast for the Proposed Project
(Person Trips)

	Midday Peak Hour			PM Peak Hour			Evening Peak Hour

Walk-Only	49	13	62	56	46	102	77	63	140

Subway Service

As shown in Table 4, on a Friday the proposed VLT installation would generate an estimated 243, 329 and 486 subway trips (in and out combined) in the midday, PM and early evening peak hours, respectively, and 281, 458 and 631 subway trips during these periods, respectively, on a Saturday. Based on existing ridership patterns, on race days (when overall demand at the project site would be greatest) most if not all inbound subway trips would arrive at the Aqueduct-North Conduit Avenue station while outbound trips would depart via the Aqueduct Racetrack station during the midday and PM peak hours, and the Aqueduct-North Conduit Avenue station in the evening peak hour. (On non-race days, all subway trips – both inbound and outbound -- would utilize the Aqueduct-North Conduit Avenue station at all times.)

As shown in Table 4, the highest project generated subway demand would occur in the Saturday evening peak hour when there would be a total of 631 subway trips -- 347 inbound and 284 outbound – all of which would occur at the Aqueduct-North Conduit Avenue station (as the Aqueduct Racetrack station currently closes at 7 PM). The highest project-generated demand at the Aqueduct Racetrack station would total 206 outbound trips in the Saturday PM peak hour. As noted previously, existing demand at both of these two subway stations is very low. The Aqueduct Racetrack station ranks 422nd in ridership out of the 423 stations in the system, with an average of 58 passengers per day on weekdays and 167 on Saturdays. The Aqueduct-North Conduit Avenue station ranks 416th in ridership with an average of 895 passengers per day on weekdays and 430 on Saturdays. Given this very low level of existing demand, it is unlikely that the anticipated demand from the Proposed Project would significantly impact operations at these two stations

Bus Service

As shown in Table 4, on a Friday the proposed VLT installation would generate an estimated 297, 402 and 594 local bus trips (in and out combined) in the midday, PM and early evening peak hours, respectively, and 344, 560 and 771 local bus trips during these periods, respectively, on a Saturday. These new trips would be distributed between the four bus routes operating in proximity to the racetrack (the Q7, Q11, Q37 and Q41). Based on the numbers of buses currently scheduled to serve the vicinity of the project site in each peak hour (see Table 2), the average number of additional passengers per bus in each peak hour would range from seven in the weekday PM peak hour to 30 in the Saturday evening peak hour. (Under current MTA Bus loading guidelines, a standard transit bus has a capacity of 65 passengers.)

As standard practice, MTA Bus routinely conducts ridership counts and adjusts bus service frequency to meet its service criteria, within fiscal and operating constraints. Therefore, no sponsor-provided improvements to local bus service would be needed as a result of the Proposed Project.

In addition to trips by local transit buses, the Proposed Project would also generate trips by charter buses. It is estimated that on weekdays, these trips would total 81 in the midday peak hour, 109 in the PM and 162 in the early evening peak hour. On Saturdays, trips by charter bus are expected to total approximately 94, 153 and 211 during these peak hours, respectively.

Pedestrians

As noted previously, existing pedestrian activity in the vicinity of the project site is relatively low. In the future with the Proposed Project, the proposed VLT installation would generate from 54 to 140 additional walk-only trips (in and out combined) in each peak hour. Walk trips associated with VLT patrons en route to and from area bus stops would add from 297 to 771 additional trips to area sidewalks, mostly concentrated along Rockaway Boulevard and Pitkin Avenue. Project-generated subway trips en route and from the Aqueduct Racetrack and Aqueduct-North Conduit Avenue subway stations are not expected to contribute substantial numbers of pedestrians to area sidewalks as there is direct access between the Aqueduct Racetrack station and the Grandstand, many of the pedestrians en route to and from the Aqueduct-North Conduit Avenue subway station utilize the free courtesy buses provided by NYRA on race days and therefore do not walk between this station to the Grandstand.

Given that existing pedestrian volumes in the vicinity of the project site are relatively low, and that project-generated walk-only and walk-bus trips would be disbursed between entrances widely spaced around the project site, significant adverse pedestrian impacts are not expected to occur as a result of the Proposed Project.

F. CONCLUSION

This attachment assesses the potential effects on transit and pedestrian facilities of the proposed installation of 4,500 video lottery terminals at the Aqueduct Racetrack. Given the very low level of existing demand at the two subway stations serving the project site, the additional subway trips generated by the Proposed Project are not expected to result in significant adverse subway station impacts in any peak hour.

In the future, should improvements be made to the Aqueduct Racetrack station immediately adjacent to the project site (e.g., installation of a new elevated walkway between the station and the Grandstand entrance, providing access to Queens-bound trains, providing daily service and increasing the hours of operation), it would not only have the potential to increase subway ridership, but would also potentially reduce traffic and parking demands.

As discussed above, there are four MTA Bus routes operating in proximity to the project site. It is possible that when the video lottery terminals begin operating 365 days per year at Aqueduct Racetrack, one or more of these routes could be re-routed into the project site. The schedules of several of these routes are currently based on providing minimum service frequency (i.e., are not demand sensitive). Therefore, it is likely that increased demand could readily be accommodated on these routes.

Walk trips associated with both transit modes as well as walk-only trips would be distributed at various entrances around the project site. Given the relatively low level of existing pedestrian activity in the vicinity of the project site, no operational impacts to pedestrian facilities are anticipated.

Appendix D

Description

LOS Definitions

Level of Service Definitions

Signal Controlled Intersections

The level of service and capacity of a signalized intersection are the criteria by which the quality of traffic service is measured. The levels of service range between level of service A (relatively congestion-free) and level of service F (congested).

The capacity of a signalized intersection is based upon the concepts of saturation flow and saturation flow rate. This is the maximum rate of flow that can pass through a given lane group under prevailing traffic and roadway conditions. The volume-to-capacity ratio is the ratio of the traffic flow for a given lane group or approach to the capacity. A V/C ratio of 1.0 indicates that the flow rate equals the capacity. Values over 1.0 indicate a temporary excess of demand. This does not necessarily indicate an intersection failure.

The level of service of a signalized intersection is evaluated on the basis of average control delay per vehicle for various movements within the intersection. The control delay is a function of the arrivals, delay from queuing and over saturation.
The following general statements may be made regarding the level of service of a signalized intersection.

- ***Level of service A*** describes operations with a very low delay. This occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short traffic signal cycles may contribute to low delay.
- ***Level of service B*** generally occurs with good progression and/or short traffic signal cycle lengths. More vehicles stop than for level of service A, causing higher average delays.
- ***Level of service C*** has higher delays than level of service B. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures, where motorists are required to wait through an entire signal cycle, may begin to appear in this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.
- ***Level of service D*** means the influence of congestion has become more noticeable. Longer delays may result from some combination of unfavorable progression, long

cycle lengths or high volume to capacity ratios. Many vehicles stop and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

- ***Level of service E*** is considered the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths and high volume to capacity ratios. Individual cycle failures are frequent occurrences.
- ***Level of Service F*** has delays that are considered unacceptable to most drivers. This condition often occurs with over saturations, i.e., when arrival flow rates exceed the capacity of the intersection. It may occur at volume to capacity ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

The following average stopped delays are utilized to determine intersection and approach roadway levels of service for signalized intersections:

LEVEL OF SERVICE	CONTROL DELAY PER VEHICLE (SEC)
A	$\leq$ 10.0
B	> 10.0 and $\leq$ 20.0
C	> 20.0 and $\leq$ 35.0
D	> 35.0 and $\leq$ 55.0
E	> 55.0 and $\leq$ 80.0
F	> 80.0

Two Way Stop Controlled Intersections

The level of service and capacity of a two-way stop controlled (TWSC) intersection are the criteria that are used to measure the quality of the traffic operations. The levels of service range between level of service A (relatively congestion-free) and level of service F (very congested).

The right of way at the TWSC intersection is controlled by stop signs on two opposing minor-street approaches (or on one leg of a “T”-type intersection). The capacity of a controlled approach is based on the distribution of gaps in the

major street traffic flow, driver judgment in selecting a gap through which to execute the desired maneuver and the follow up time required by each driver in a queue.

The level of service for the subject lane group movement of an approach of a TWSC intersection is evaluated based on the average total delay per vehicle. Control delay is a function of the capacity of the approach and the degree of saturation. It is defined as the total elapsed time from the time a vehicle stops at the end of the queue to the time the

vehicle departs from the stop line. This includes the time required for the vehicle to travel from the end of the queue position to the first-in-queue position, including deceleration of vehicles from free-flow speed to the speed of vehicles in the queue. The average approach delay for all vehicles on a particular approach is computed as the weighted average of the control delay estimates for each individual movement on the approach.

The following levels of average control delay are used to determine approach levels of service:

LEVEL OF SERVICE	CONTROL DELAY PER VEHICLE (SEC)
A	≤ 10.0
B	> 10.0 and ≤ 15.0
C	> 15.0 and ≤ 25.0
D	> 25.0 and ≤ 35.0
E	> 35.0 and ≤ 50.0
F	> 50.0

While the level of service criteria are applied to each approach of a TWSC intersection, the average delay for an entire intersection can be calculated by taking a weighted average of the vehicles stopped on the minor approaches and the vehicles in the major street traffic flow, which suffer no delays. This total average control delay provides a means of comparison for two intersections.

All Way Stop Controlled Intersections

The level of service and capacity of an all way stop controlled (AWSC) intersection are the criteria by which the quality of traffic service is measured. The levels of service range between level of service A (relatively congestion-free) and level of service F (very congested).

The key variable in determining the capacity of an AWSC intersection is the distribution of traffic volumes among the approaches. Under ideal conditions traffic would be evenly distributed among the approaches. The flow rate for any given approach increases as the traffic decreases on the other approaches, allowing a smaller headway between vehicles departing from the stop line.

The capacity of each approach is computed under the assumption that the flows on the opposing and conflicting approaches are constant. The level of service of an AWSC intersection is evaluated based on the average total delay per vehicle. Total delay is defined as the total elapsed time from when a vehicle stops at the end of a queue until the vehicle departs from the stop line. This includes the time required for the vehicle to

travel from the end of the queue position to the first-in-queue position, including deceleration of vehicles from free-flow speed to the speed of vehicles in the queue. This delay is based on the flow rate for each approach. As indicated above, the flow rate and therefore the delay, is directly proportional to the distribution of vehicles among the approaches.

The following levels of average control delay are used to determine approach levels of service:

LEVEL OF SERVICE	CONTROL DELAY PER VEHICLE (SEC)
A	≤ 10.0
B	> 10.0 and ≤ 15.0
C	> 15.0 and ≤ 25.0
D	> 25.0 and ≤ 35.0
E	> 35.0 and ≤ 50.0
F	> 50.0

The average control delay is the most effective measure for indicating the performance of an AWSC intersection because it can readily be measured by a transportation analyst and can be clearly communicated to a lay person. In addition, the use of delay will result in a consistent measure for both signalized and unsignalized intersections. While both types of intersections are evaluated in terms of average delay, the level of service criteria are different. This is due to drivers who expect different levels of performance from different types of intersection controls. Since signalized intersections are designed to carry higher traffic volumes compared with AWSC intersections, higher levels of control delay are more acceptable at signalized intersections for the same level of service.
